

Update on Delta Inflow/Outflow Evaluations

BDCP Conveyance/HOTT Meeting
May 28, 2009

Part I.

Approaches Evaluated for Achieving Delta Flows

Background of BDCP Ops Effort

- December 19, 2008, issued Overview Document
 - Left the issue of Delta outflow unresolved;
 - Recognized that appropriate targets for Delta outflow have been vigorously debated;
 - Used D-1641 for DRERIP purposes;
 - Committed to evaluate a range of targets.

Delta Flow Complexities

- Changes to Delta flow affect to varying degrees:
 - Upstream coldwater management
 - Outflow and X2 location
 - Water supply reliability
- Tradeoffs are unavoidable
- Delta flow can be achieved through changes in:
 - Outflow
 - Inflow
 - Reservoir Releases

BDCP Approaches for Delta Flow

- Explore a range of inflow/outflow approaches for consideration in BDCP planning
- Consider improved, simplified methods for providing Delta inflows/outflows that better balance competing needs

Two Main Approaches Explored for Spring Flows

- Delta Outflow/X2
 - Focuses on achieving Feb-Jun average X2 based on seasonal hydrologic index for Sacramento and San Joaquin Valleys
 - Management point is Delta outflow
 - Distribution of upstream flows is product of coordinated SWP and CVP operations
- Proportionate Reservoir Release (PRR)
 - Focuses on tributary and Delta hydrologic synchrony to achieve biologically-based seasonal targets for floodplain and secondary channel inundation
 - Management point is at Keswick, Thermalito, and Nimbus
 - Outflow is product of PRR values, plus Hood Bypass and OMR requirements

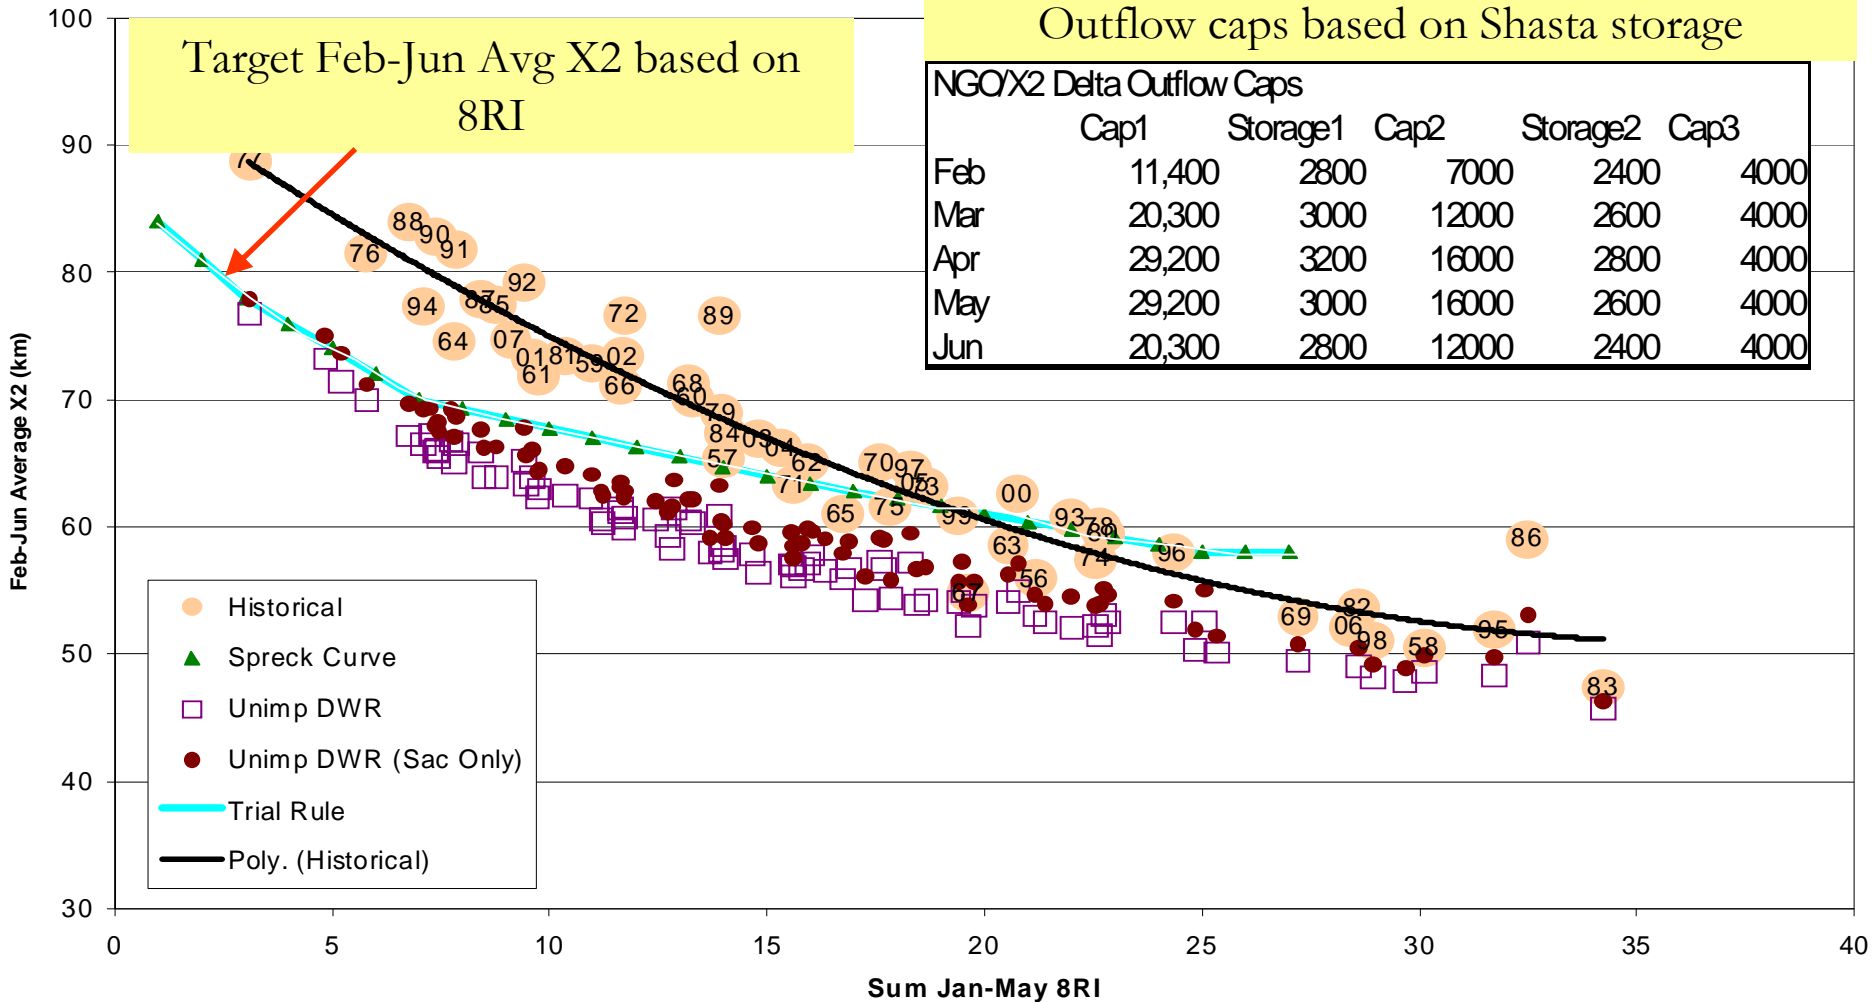

Delta Outflow/X2 Approach (Modified NGO X2)

X2 Relationship to Eight River Index - (JUNE FORECAST)
Historic 1956-2007 Data (CDEC and DAYFLOW)

Target Feb-Jun Avg X2 based on 8RI

Outflow caps based on Shasta storage

| NGO/X2 Delta Outflow Caps | | | | | |
|---------------------------|--------|----------|-------|----------|------|
| | Cap1 | Storage1 | Cap2 | Storage2 | Cap3 |
| Feb | 11,400 | 2800 | 7000 | 2400 | 4000 |
| Mar | 20,300 | 3000 | 12000 | 2600 | 4000 |
| Apr | 29,200 | 3200 | 16000 | 2800 | 4000 |
| May | 29,200 | 3000 | 16000 | 2600 | 4000 |
| Jun | 20,300 | 2800 | 12000 | 2400 | 4000 |

Proportionate Reservoir Release Approach

Seasonal instream flow targets as percentage of reservoir inflow

Minimum flow caps based on storage

| | Jan | Feb | Mar | Apr | May | Jun |
|---|--------|------|------|------|------|------|
| Keswick <input checked="" type="checkbox"/> | 0 | 0.2 | 0.4 | 0.6 | 0.6 | 0.4 |
| Thermalito <input checked="" type="checkbox"/> | 0 | 0.2 | 0.4 | 0.6 | 0.6 | 0.4 |
| Nimbus <input checked="" type="checkbox"/> | 0 | 0.2 | 0.4 | 0.6 | 0.6 | 0.4 |
| Verona <input type="checkbox"/> | 0.6 | 0.6 | 0.6 | 0.5 | 0 | 0 |
| Shasta Storage trigger for Low% | 0 | 2600 | 2600 | 2800 | 2200 | 2200 |
| Freeport <input type="checkbox"/> | Low % | | | | | |
| | High % | 0 | 0.3 | 0.3 | 0.3 | 0.3 |
| Delta Outflow* <input type="checkbox"/> | 0 | 0.4 | 0.4 | 0.4 | 0.4 | 0.4 |

| Reservoir Bypass Flow Caps (Shasta) | | | | | |
|-------------------------------------|--------|----------|-------|----------|------|
| | Cap1 | Storage1 | Cap2 | Storage2 | Cap3 |
| Feb | 10,000 | 2800 | 6,625 | 2400 | 3250 |
| Mar | 10,000 | 3000 | 6,625 | 2600 | 3250 |
| Apr | 10,000 | 3200 | 6,625 | 2800 | 3250 |
| May | 10,000 | 3000 | 6,625 | 2600 | 3250 |
| Jun | 10,000 | 2800 | 6,625 | 2400 | 3250 |

| Reservoir Bypass Flow Caps (Oroville) | | | | | |
|---------------------------------------|-------|----------|-------|----------|------|
| | Cap1 | Storage1 | Cap2 | Storage2 | Cap3 |
| Feb | 4,000 | 2000 | 2,375 | 1300 | 750 |
| Mar | 4,000 | 2200 | 2,375 | 1500 | 750 |
| Apr | 4,000 | 2400 | 2,375 | 1700 | 750 |
| May | 4,000 | 2200 | 2,375 | 1500 | 750 |
| Jun | 4,000 | 2000 | 2,375 | 1300 | 750 |

| Reservoir Bypass Flow Caps (Folsom) | | | | | |
|-------------------------------------|-------|----------|-------|----------|------|
| | Cap1 | Storage1 | Cap2 | Storage2 | Cap3 |
| Feb | 3,000 | 350 | 1,900 | 250 | 800 |
| Mar | 3,000 | 400 | 1,900 | 300 | 800 |
| Apr | 3,000 | 450 | 1,900 | 350 | 800 |
| May | 3,000 | 400 | 1,900 | 300 | 800 |
| Jun | 3,000 | 350 | 1,900 | 250 | 800 |

*Delta Outflow is set to a percent of forecasted unimpaired SACR flows plus 100% of SJF

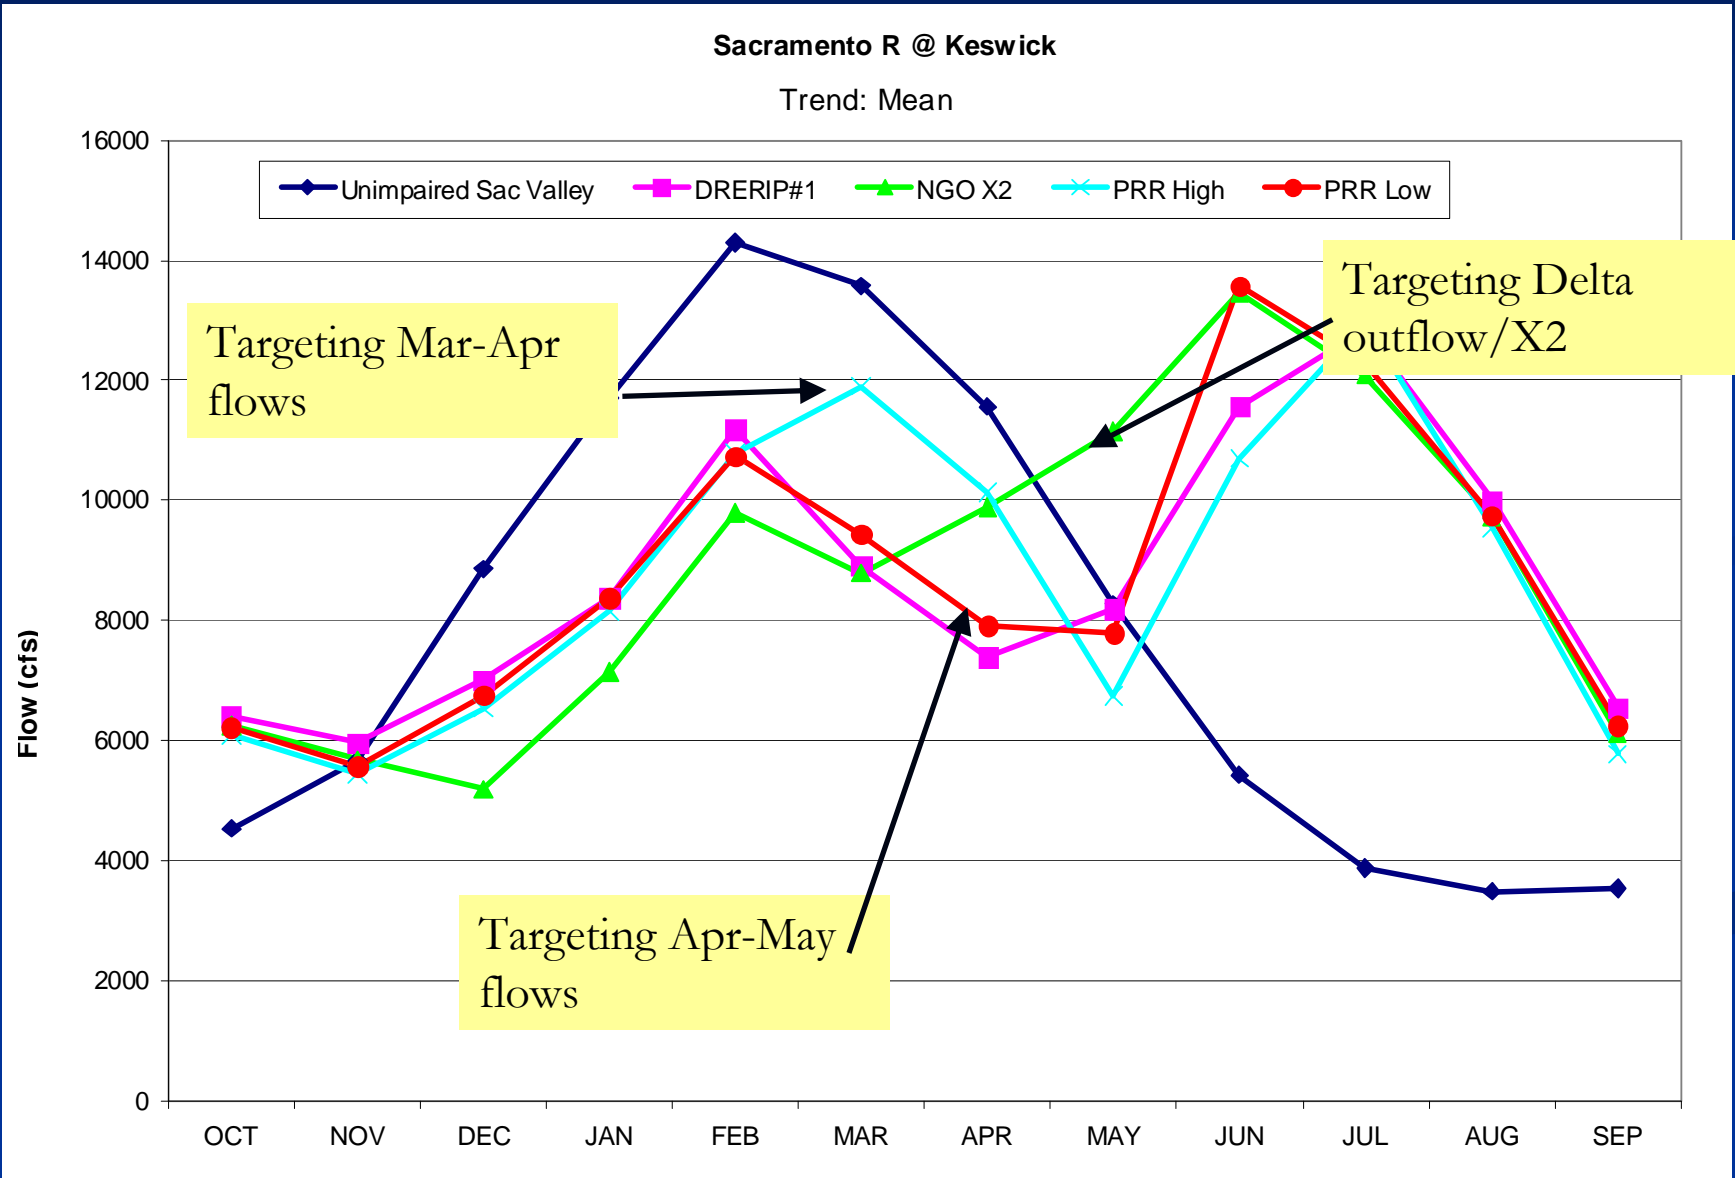

Preliminary Biological Flow Thresholds

| Location | Biological Justification | Frequency | Threshold | Timing | Duration |
|----------------------------|--|--------------------------------|--------------------|------------------|--------------|
| Sacramento River (Keswick) | Seasonal inundation of off-stream channels and habitat to support rearing and outmigration | Once per year (as able) | 8,500 - 12,500 cfs | February – April | 7 - 30+ days |
| Sacramento River (Verona) | Yolo Bypass floodplain inundation (3,000 to 6,000 cfs) through modified Fremont Weir | Once every two years (as able) | > 35,000 cfs | February - April | 30+ days |
| Feather River (Mouth) | Seasonal inundation of off-stream channels and habitat to support rearing and outmigration | Once per year (as able) | > 8,000 cfs | February – April | 7 – 30+ days |

PRR Approach: Primary Modeling Objectives

- Improve synchrony during months most askew from unimpaired flow patterns (Feb-Jun)
- Provide instream flows when thresholds most likely to be achieved (i.e. would 75% of unimpaired have achieved the threshold?)
- Limit releases to those justifiable by biological thresholds to limit impacts to coldwater pool and export water supply

PRR Approach Could Improve Synchrony

PRR Approach Could Improve Synchrony

PRR Approach Could Improve Synchrony

Potential Yolo Bypass Inundation Frequencies

Sacramento R @ Verona

Percent of Time Threshold Exceeded: 30000

Potential Sac River Seasonal Floodplain Inundation Frequency

Sacramento R @ Wilkins SI

Percent of Time Exceeded Threshold for Sac R Seasonal Floodplain Inundation

Potential Feather River Seasonal Floodplain Inundation

Feather R @ Mouth

Percent of Time Exceeded Threshold for Feather R Seasonal Floodplain Inundation

Next Steps

- PRR scenarios need revision to better identify and target upstream biological objectives
- Delta outflow/X2 scenario could be hybridized with the PRR approach to better synchronize upstream flows
- Need to limit major conflicts with upstream temperature control (species vs species trade-off)

Part II.

Potential Approach for Evaluating Range of Delta Outflows

Bookend Approach to Evaluate Range of Delta Outflows

- Consider relatively HIGH and LOW
 - Hood Bypass flows requirements
 - Old and Middle River flow requirements
- Consider two methods for spring releases
 - NGO X2 approach
 - Proportionate Reservoir Release (PRR) approach

Can Rules be Derived to Describe a Range of Outflow?

X2 Relationship to Eight River Index - (JUNE FORECAST)
Historic 1956-2007 Data (CDEC and DAYFLOW)

Current Scenario Assumptions

- Hood Bypass

Utilized BDCP Option #1 for all scenarios except D1641

- South of Delta

Utilized BDCP OMR constraints:

-3,500 cfs Dec – Jun

-5,000 cfs Jul – Nov

- San Joaquin River Inflow

Fully impaired current condition

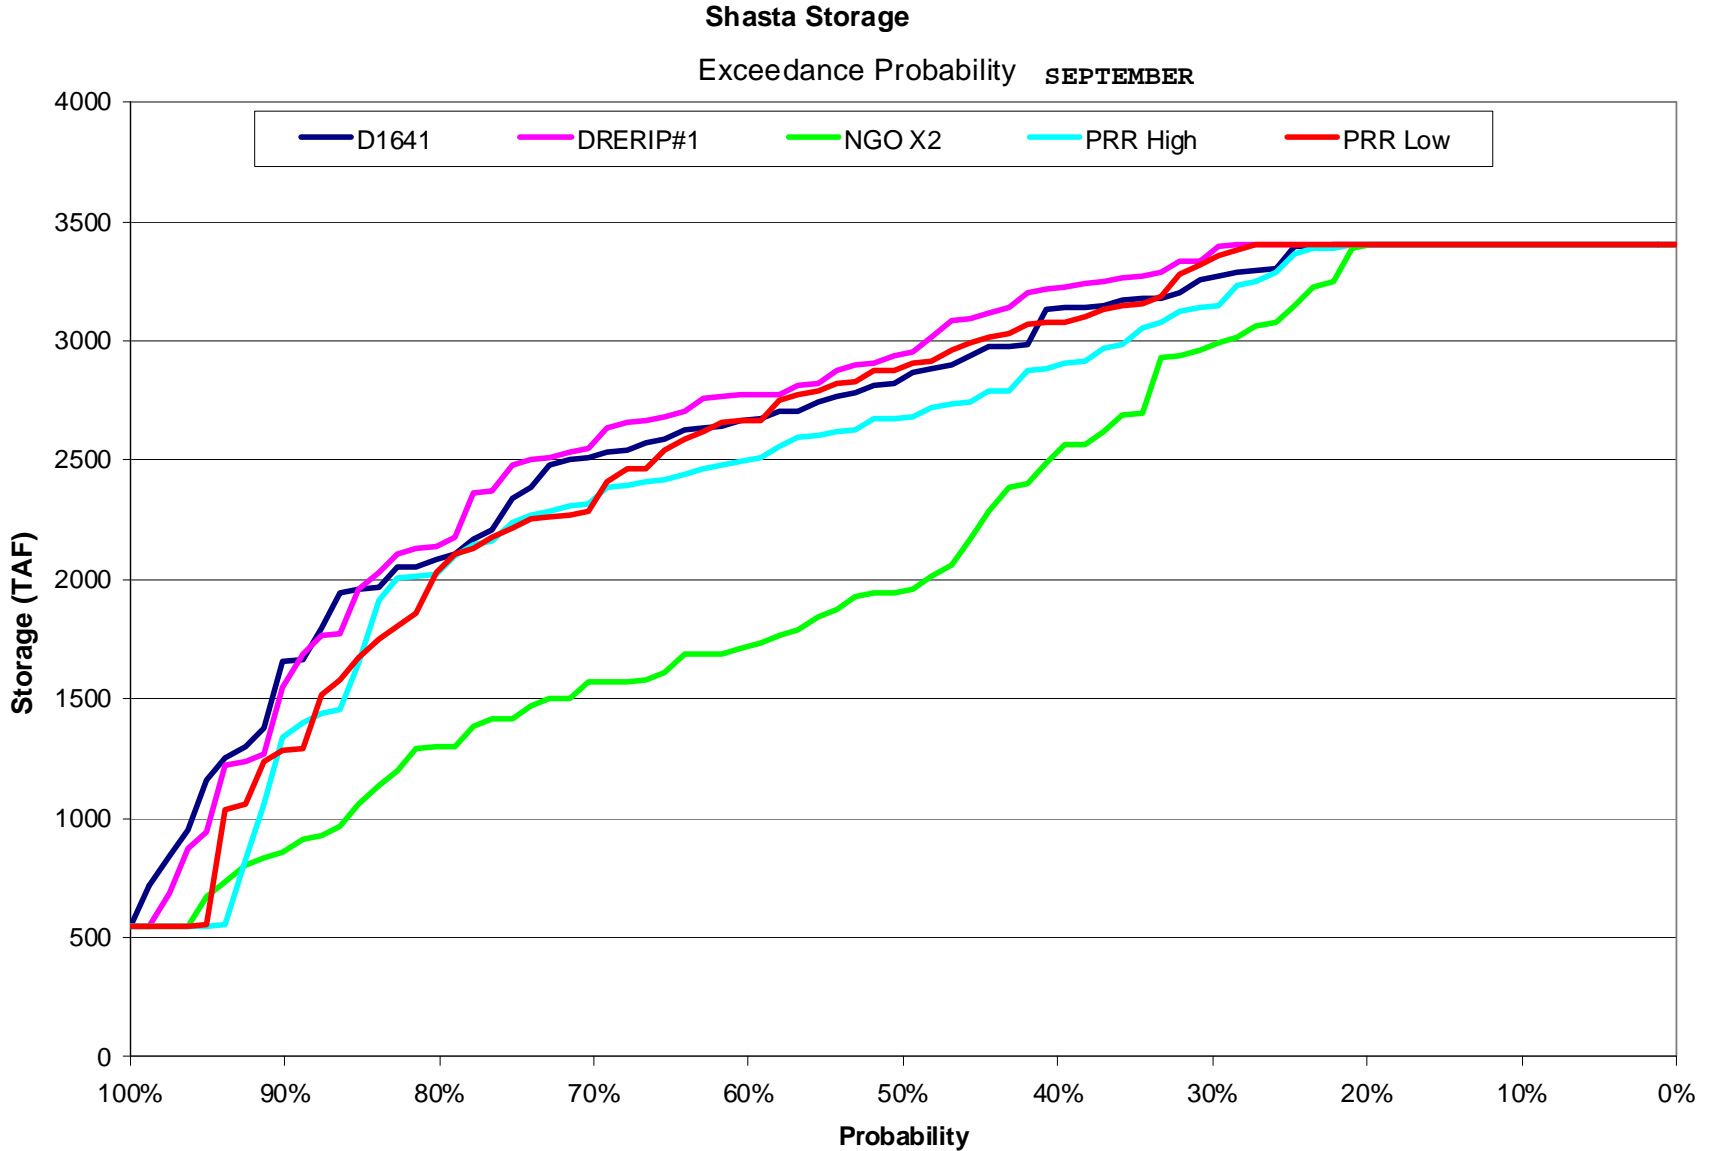

- All other current standards assumed to exist.

Assumptions for Scenarios

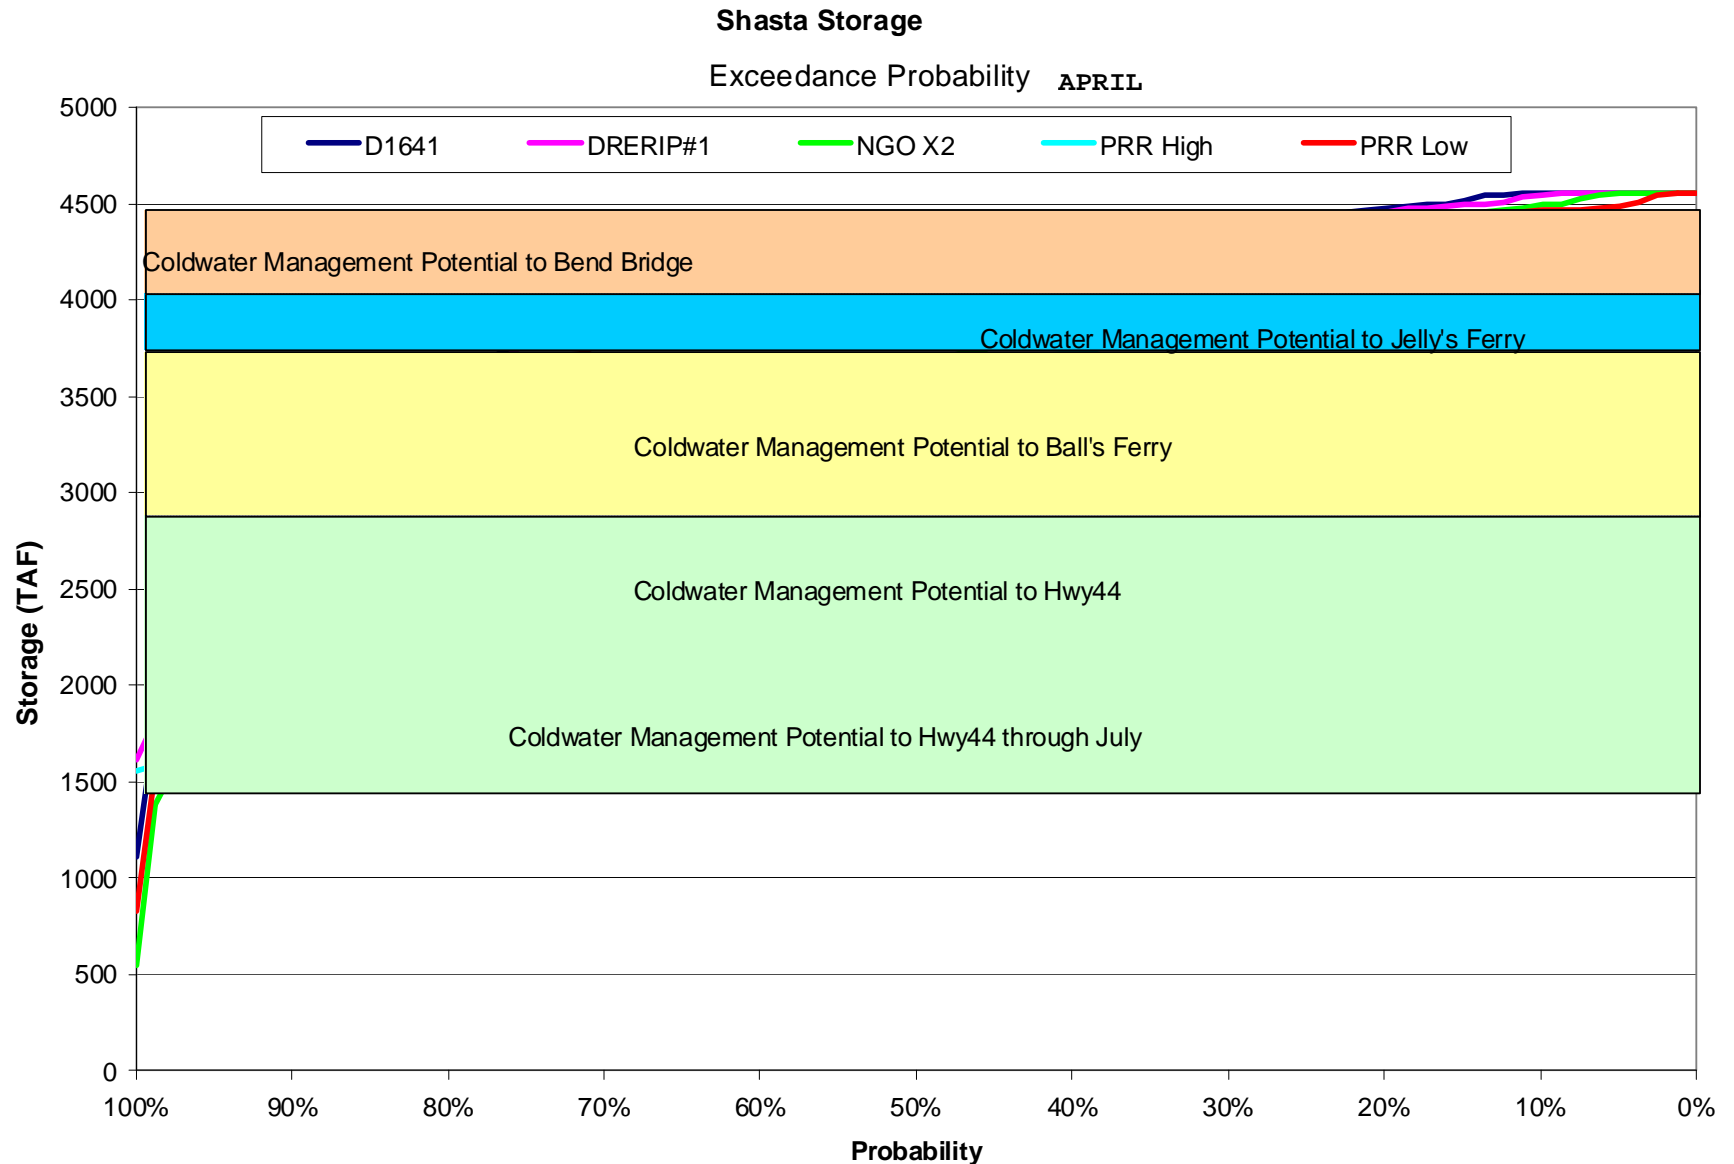

- Scenario 1: D-1641 with existing facilities
- Scenario 2: BDCP DRERIP #1
- Scenario 3: NGO X2 proposal
- Scenario 4: PRR#1 + HIGH Hood & OMR req.
 - PRR: 40%, 100%, 100%, 60%, 40% of inflow (Feb-Jun, respectively)
 - Hood Bypass: 13,500 cfs Dec-Jun; 7,000 cfs Jul-Nov (percentage criteria same as DRERIP scenario)
 - OMR: -2,000 cfs Dec-Jun; -5000 cfs Jul-Nov
- Scenario 5: PRR#2 + LOW Hood & OMR req.
 - PRR: 20%, 40%, 60%, 60%, 40% of inflow (Feb-Jun, respectively)
 - Hood Bypass: 5,000 cfs during all months (percentage criteria same as DRERIP scenario)
 - OMR: -3,500 cfs Dec-Feb; -5000 cfs Mar-Jun; no requirement Jul-Nov

Can Rules be Derived to Describe the Outflow Range?

X2 Relationship to Eight River Index - (JUNE FORECAST)
Historic 1956-2007 Data (CDEC and DAYFLOW)

Next Steps

- PRR scenarios need revision to better target upstream biological objectives
- If a range outflow is desired, then an X2 (or Outflow) vs 8-RI rule can be derived to describe the range
- Mechanism for achieving Delta flows will be necessary to describe impacts, both positive and negative
