

There are 2 easily implemented ways to deal with the fish / pumping issue that is not currently being considered:

- 1) Put in a combinations of nets and water jet nozzles to artificially guide the fish down stream instead of making the lefts towards the pumping stations. These nets and jet nozzles would be put in the critical junctions and run when fish are coming down stream.
- 2) Drill a horizontal pipe line from the pumps down and back to the delta far past the diversion areas so that the flow of water would still guide them to the sea. Fish near the pumps can be guided and easily dumped in the pipeline, so they are diverted quickly and easily out of harm's way.
