

## 28.1 Introduction

This chapter analyzes the potential for the alternatives to cause disproportionately high and adverse human health or environmental effects on minority and low-income populations. This determination is required under Executive Order (EO) 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations* (59 Federal Register [FR] 7629), which requires an analysis of federal actions that have the potential to result in disproportionately high and adverse effects on minority and low-income populations. Memorandum No. ECM 95-3 (U.S. Department of the Interior 1995a) provides guidance for complying with EO 12898 and evaluation of the equity of impacts imposed on these populations relative to the benefit of the action. Unlike the executive order, CEQA does not require an analysis of environmental justice.

For purposes of this analysis, the definitions of minority and low-income populations provided in the Council on Environmental Quality's (CEQ's) *Guidance for Agencies on Key Terms in Executive Order 12898* (Council on Environmental Quality 1997) are used.

*Minority individuals* are defined as members of the following population groups.

- American Indian or Alaskan Native.
- Asian or Pacific Islander.
- Black.
- Hispanic.

*Minority populations* are identified by the following factors.

- Where the minority population percentage of the affected area is meaningfully greater than the minority population percentage of the general population.
- Where the minority population percentage of the affected area exceeds 50% (Council on Environmental Quality 1997).

*Low-income populations* are identified based upon poverty thresholds provided by the U.S. Census Bureau (Council on Environmental Quality 1997:25), and identified as one of the following.

- The population percentage below the poverty level is meaningfully greater than that of the population percentage in the general population.
- The population percentage below the poverty level in the affected area is equal to or exceeds 20% (see Section 28.2.3 for additional discussion on how this threshold was reached).

Significant concentrations of minority or low-income individuals are sometimes referred to as *environmental justice populations*. Historically, low-income and minority populations have suffered a greater share of the adverse environmental and health effects of industry and development relative to the benefits. The identification and mitigation of this potentially disproportionate burden is referred to as *environmental justice* (Rechtschaffen and Gauna 2002:3). The current regulatory

1 framework for environmental justice reflects the convergence of civil rights concerns and  
 2 environmental review processes. In the 1980s community organizers and environmental regulators  
 3 identified three interrelated concerns. First, these groups identified a significant correlation  
 4 between hazardous waste and other polluting facilities and demographic concentrations of minority  
 5 and low-income communities. Second, advocates noticed that minority and low-income  
 6 communities incurred a greater burden of environmental consequences relative to the benefits of  
 7 industry and development, compared to the population at large. Third, minority and low-income  
 8 communities often suffered a relative lack of access and involvement in environmental decision  
 9 making relative to the population at large (Rechtschaffen and Gauna 2002:3). Environmental justice  
 10 is now regulated through federal policy, with the assessment of environmental justice effects  
 11 occurring as part of the National Environmental Policy Act (NEPA) process.

12 This chapter first provides an overview of the minority and low-income populations in the study  
 13 area (the area in which impacts may occur) that are relevant for analysis of environmental justice  
 14 effects. The study area consists of the geographic vicinity surrounding the footprint of the Plan Area  
 15 (the area covered by the BDCP) where effects have the potential to affect minority and low-income  
 16 populations. A discussion of the regulatory setting follows, identifying the laws and policies that  
 17 govern the decision-making processes of relevant federal agencies with a role in implementing the  
 18 BDCP. This chapter then analyzes the potential for the alternatives to result in disproportionately  
 19 high and adverse environmental or health consequences on minority and low-income populations.  
 20 This chapter does not analyze effects on community character, social and economic characteristics,  
 21 or the balance of population, employment and housing; these topics are covered in Chapter 16,  
 22 *Socioeconomics*, Section 16.3.3.

## 23 **28.2 Environmental Setting/Affected Environment**

### 24 **28.2.1 Identification of Environmental Justice Populations in** 25 **the Study Area**

26 The following discussion describes minority, Hispanic, and low-income communities in the study  
 27 area based on data from the 2010 decennial census. This section first identifies the census blocks  
 28 with meaningfully greater total minority and Hispanic populations. A description of the overall  
 29 distribution of minorities in the study area as well as relevant cultural practices and places follows.  
 30 The section then describes block groups with meaningfully greater low-income populations as well  
 31 as relevant employment characteristics associated with these populations.

32 The U.S. Census Bureau collects comprehensive demographic data every 10 years during the  
 33 decennial census. This analysis uses data from the 2010 decennial census data (i.e., U.S. Census  
 34 Bureau 2010). The U.S. Census Bureau collects demographic information on ethnicity at the level of  
 35 census blocks (the smallest geographic unit used by the U.S. Census Bureau). Generally, several  
 36 census blocks make up block groups, which make up census tracts. The population of a census block  
 37 can vary, depending on the urban or rural nature of the area. Hispanic status is considered a  
 38 geographic place of origin, rather than ethnicity, by the U.S. Census Bureau and is collected at the  
 39 block level.

### 28.2.1.1 Meaningfully Greater Populations

Total minority data includes the constituent ethnic categories of Black/African-American, Asian, Native Hawaiian or Pacific Islander, and American Indian or Alaskan Native. Hispanic populations include persons originating in or descended from populations in Latin America and portions of the Caribbean. Consistent with the CEQ's 1997 Guidance, census blocks with greater than 50% total minority or Hispanic populations (minorities or minority populations) were identified within the study area.

Poverty status data is collected by the U.S. Census Bureau at the level of census block groups, a geographic unit that includes census blocks but is smaller than census tracts. For purposes of this analysis, low-income populations consist of persons living below the 2010 poverty threshold as defined by the U.S. Census Bureau (U.S. Census Bureau 2010). Meaningfully greater low-income populations were identified by low-income block groups (i.e., low-income populations) that contained 20% or greater low-income individuals (i.e., below the 2010 poverty threshold). Because the income required to sustain a household varies in relation to the number of individuals dependent upon a given quantity of income, there is no single threshold for poverty status (U.S. Census Bureau 2010). The 20% threshold was used because the cost of living in California is higher than elsewhere in the country, and thus the use of a 50% threshold might incorrectly under-identify low-income populations in the study area.

### 28.2.1.2 Minority Populations

Figure 28-1 depicts the census blocks with greater than 50% minority populations within the Plan Area. These data were generated based upon census data collected for all minority and Hispanic populations within the Plan Area, and included Appendix 28A, *Census Data*, Tables 28A-1 and 28A-2. In general, Figure 28-1 shows a wide distribution of census blocks with meaningfully greater minority residents. Areas exhibiting high proportions of minority residents are present in both urban and rural areas, with many agricultural areas in the interior Delta exhibiting high proportions of minority residents.

The portion of the city of Sacramento within the study area is relatively small compared with the city's total urban area, but a concentration of minority residents is present in the Pocket area, west of Interstate 5 (I-5) and east of the Sacramento River. A similar concentration of minority residents is present immediately east of I-5 on both sides of Meadowview Road.

Urban areas in the city of Stockton also demonstrate high proportions of minority residents. Concentrations occur along I-5 going north from downtown Stockton. New development north of Mosher Slough in north Stockton also exhibits a high proportion of minority residents. A large cluster of minority residents north of Stockton is present near Stagg High School, just west of Akers. The areas south of the Port of Stockton on both sides of I-5 contain a high proportion of minority residents. The neighborhoods bounded by Charter Road in the north, I-5 to the east, and French Camp slough to the west and south also have high proportions of minority residents.

Minority residents in the city of Tracy, located in the southern end of the Delta, are mostly clustered on the edges of the urban area. Minority residents in other communities in the Delta, such as Brentwood and Oakley, do not generally cluster and are distributed throughout these areas. For example, census statistics for Brentwood show that only a few areas in the urbanized area show concentrations of minority residents, with the largest clusters located northeast of the community in

1 the rural, agricultural areas. In the community of Oakley, a large concentration of minority residents  
2 is located east of Oakley Elementary School and south of State Route (SR) 4.

3 The city of Antioch exhibits relatively few areas with high proportions of minority residents,  
4 although one distinct cluster is located northeast of the city near Antioch High School, just east of  
5 Pittsburg. The city of Pittsburg, however, is almost completely composed of areas identified as  
6 having high proportions of minority residents.

7 As mentioned previously, there is a widespread distribution of areas identified as having high  
8 proportions of minority residents. These areas include a number of rural, agricultural communities  
9 in the study area. Many of the census blocks displayed in Figure 28-1 are relatively large because of  
10 the low population density residing in these areas. These census data show that the rural  
11 communities of Clarksburg, Hood, Courtland, Paintersville, Vorden, Locke, Walnut Grove, Ryde,  
12 Isleton, Maine Prairie, Bunker, Oxford, Thornton, Holt, and Gillis exhibit meaningfully greater  
13 proportions of minority residents. In addition to these communities, large rural areas outside  
14 designated communities also contain high proportions of minority residents, many of which have  
15 social and economic ties to the larger urban areas of Sacramento, Stockton, Tracy, Antioch, and  
16 Pittsburg.

### 17 **28.2.1.3 Hispanic Residents**

18 Figure 28-1 also includes the distribution of areas with meaningfully greater proportions of  
19 Hispanic residents in the study area. Of minority groups present in the study area, Hispanics are the  
20 most widely dispersed, and the concentrations of Hispanic populations are the most varied in their  
21 location, being present in both urban and rural locations. Of the major urban locations in the study  
22 area, Hispanic residents are the most concentrated in Pittsburg, with a large presence throughout  
23 the urban area centered on Railroad Avenue and California Avenue. High proportions of Hispanic  
24 residents are also located in Antioch, particularly in areas north of SR 4 and northeast of the Antioch  
25 Fairgrounds. To the east, Oakley has a concentrated population of Hispanic residents in the  
26 northeastern end of the city, south of SR 4 and close to its intersection with O'Hara Avenue. Other  
27 urban areas in the western Delta with high proportions of Hispanic residents include Brentwood,  
28 where a concentrated population of Hispanic residents is present along SR 4 north to Oakley. These  
29 areas are also near Knightsen, although the concentrated areas of Hispanic residents are generally in  
30 suburban areas along SR 4.

31 Stockton also has a large distribution of Hispanic residents, although many of the areas with  
32 meaningfully greater proportions are scattered throughout the urban sections near the I-5/SR 4  
33 interchange and areas of downtown Stockton north of Weber Point. The Hispanic population in  
34 Tracy is also relatively clustered, generally located east of Tracy Boulevard in the urban area.

35 Meaningfully greater proportions of Hispanic residents are present throughout the rural,  
36 agricultural lands of the Delta. A number of the smaller Delta communities discussed above also  
37 have concentrated Hispanic populations, including smaller towns on the periphery of the Delta such  
38 as Byron, Carbona, Banta, Cochrane, Lathrop, Gillis, Holt, Thornton, West Sacramento, Yolo, Bunker,  
39 Maine Prairie, and Rio Vista. Hispanic populations are also present in the small towns along the  
40 Sacramento River, including Clarksburg, Hood, Courtland, Paintersville, Vorden, Locke, Walnut  
41 Grove, Ryde, and Isleton. Finally, Hispanic populations are present on a number of agricultural  
42 islands and tracts outside the direct influence of a town center, especially in the northwest (centered

1 loosely in Bunker), the eastern edge (east of Isleton), and the southern end (centered loosely in  
2 Holt) of the Delta.

### 3 **28.2.1.4 Characteristics of Relevant Minority Populations**

4 The following discussion presents socioeconomic and cultural information pertaining to individual  
5 minority groups in the Delta and vicinity. The information presented here was gathered primarily  
6 through an outreach effort conducted by the Delta Habitat Conservation and Conveyance Program  
7 (DHCCP). The outreach effort solicited and compiled the information provided by respondent  
8 members of minority groups regarding cultural significant practices as well as subsistence activity.  
9 This information was augmented with related secondary sources, and is meant to provide an  
10 example of the types of behaviors present in the diverse Delta area that may be affected by the  
11 action alternatives.

### 12 **28.2.1.5 Cultural Practices and Social Activities**

13 Cultural practices associated with particular minority groups, such as dancing, singing, holiday  
14 celebrations, and religious observances, may take place as part of the social activities described  
15 below. Unless otherwise indicated, the source of information for the following discussion is the  
16 Environmental Justice Community Survey Summary Report prepared for the BDCP (California  
17 Department of Water Resources 2010).

18 The Delta is home to many social activities and special events that residents view as important for  
19 bringing people together and maintaining a sense of community. Activities valued by residents  
20 throughout the Delta include agricultural activities, extracurricular activities associated with  
21 schools, wine-tasting events, recreational activities, library fundraisers, religious events, educational  
22 activities, street fairs, farmers' markets, health fairs, and cultural events.

23 Examples of events that are important to Delta communities include the Courtland Pear Fair, Catfish  
24 Jubilee, Clarksburg Fun Run, Tracy Bean Festival, Fourth of July parades, Stockton Asparagus  
25 Festival, Rio Vista Bass Festival, Creek Walk, Sacramento Jazz Festival and Jubilee, Pittsburg Seafood  
26 Festival, Ag Venture Days, Isleton Crawdad Festival (renamed the Cajun Festival in 2012) and  
27 annual pumpkin patches. These activities and events draw both minority group and nonminority  
28 group participants.

29 Input received through the lead agencies outreach effort indicates that multiple ethnic/racial groups  
30 in the Delta participate in activities and events such as Hot Summer Nights, Jazz Fest, farmers'  
31 markets, and Thursday Car Shows. However, many activities and events are more strongly  
32 associated with specific minority groups.

### 33 **28.2.1.6 Culturally Relevant Places, Neighborhoods, Businesses, and** 34 **Farmlands**

35 The following discussion provides an overview of places and businesses of cultural relevance to  
36 minority groups in the Delta that are near the footprint of the action alternatives and therefore may  
37 be relevant to environmental justice effects. Because many Delta residents share values and a way of  
38 life that emphasizes a rural lifestyle, the vast majority of places and businesses in Delta communities  
39 attract people from several racial and ethnic groups. During early outreach efforts, specific  
40 responses were not received related to places or businesses that are culturally valued by  
41 Black/African-American, Native Hawaiian and Pacific Islander, and American Indian or Alaska

1 Native residents. However, culturally valued places and businesses for Delta minority groups may  
 2 include places such as religious institutions, community centers, favored hunting or fishing  
 3 locations, neighborhoods, the Delta's waterways, and minority-owned markets and restaurants.

4 Asian communities with strong cultural ties to water may value the Delta's waterways. Specific  
 5 points of interest to Asian communities may include the Chinese and Japanese area of Isleton and  
 6 Locke's Chinatown. The Chinese and Japanese area of Isleton is registered today as a national  
 7 historic district. Locke's Chinatown represents the largest, most complete example of a rural,  
 8 agricultural Chinese-American community in the United States (National Park Service 2010).  
 9 Although some Chinatowns in the Delta (e.g., Walnut Grove, Courtland, Rio Vista) began to disappear  
 10 during the middle of the 20th century, Locke remained primarily Chinese through the 1970s  
 11 (National Park Service 2010). Today, the number of Chinese residents in Locke is low, they are  
 12 typically older and retired, and the total population of Locke is estimated at around 70.

13 Agricultural issues were also raised by ethnic groups during outreach. Specifically, ethnic groups  
 14 cited agricultural resources as one of the best attributes of the Delta. Delta ethnic groups are  
 15 concerned about water rights, lack of water, and salinity. Most of the respondents indicated that  
 16 Latinos are the primary ethnicity employed by the agricultural industry in the Delta; however, some  
 17 respondents indicated other groups, such as Asian, German, Portuguese, Italian, and Caucasian, are  
 18 the primary ethnicity employed by the industry.

### 19 **28.2.1.7 Subsistence and Recreational Activities**

20 This section provides an overview of subsistence activities for individual Delta minority groups.  
 21 According to Silver et al. (2007), fishing is a valued activity for minority groups in the Delta. For  
 22 these populations, fishing is both a social or recreational activity and a food source. People who  
 23 catch and eat fish as one of the primary food sources are often considered subsistence fishers. The  
 24 U.S. Environmental Protection Agency (EPA) describes subsistence fishers as people who rely on  
 25 noncommercial fish as a major source of protein and suggests that subsistence fishers tend to  
 26 consume noncommercial fish and/or shellfish at higher rates than other fishing populations, and for  
 27 a greater percentage of the year, for cultural and/or economic reasons (U.S. Environmental  
 28 Protection Agency 1994; U.S. Environmental Protection Agency 1996). NMFS also describes  
 29 subsistence fishing as fishing for personal consumption or traditional/ceremonial purposes (NOAA  
 30 1997). Native American, lower income urban, rural, and Asian-American populations often include  
 31 subsistence fishers (U.S. Environmental Protection Agency 1997).

32 Fish found in many waterways throughout the United States have high levels of toxins because of  
 33 water pollution. Toxins pose a health risk when these fish are consumed by humans. Mercury is  
 34 found in the Delta because it naturally occurs there and because of human activities, such as historic  
 35 gold mining in the Delta's upper tributaries. Delta fish consumption is of particular concern because  
 36 of contamination by methylmercury, a neurodevelopmental toxin (Silver et al. 2007).

37 Fish consumption rates differ for specific subpopulations, based on factors such as race, ethnicity,  
 38 age, and sex (Office of Environmental Health Hazard Assessment 2001). Throughout the United  
 39 States, minority groups, low-income communities, tribes, and other indigenous peoples tend to have  
 40 higher fish consumption rates than the general population (U.S. Environmental Protection Agency  
 41 2002) with subsistence fishers consuming over eight times the general population consumption  
 42 level.

1 Because of high fish consumption rates, minority populations throughout the United States tend to  
2 have high levels of mercury (particularly Asians, Pacific Islanders, and Native Americans) (Silver et  
3 al. 2007). Minority and low-income populations throughout the United States have also been found  
4 to have a low awareness of the risks involved with consuming fish contaminated with mercury  
5 (Silver et al. 2007). Fish consumption rates for subsistence fishers vary by season and availability of  
6 preferred species. The following discussion presents information about subsistence fishing by  
7 individual Delta minority groups.

8 According to key informant interviews, sportfishing is practiced year-round in the Delta. Southeast  
9 Asians, Latinos, and houseboat residents commonly catch and consume catfish, largemouth bass,  
10 bluegill, and carp (California Department of Health Services 2004). Southeast Asians also harvest  
11 clams for consumption. The results of the interviews with San Joaquin County health and  
12 environmental health professionals indicate that Southeast Asian, Latino, and African-American  
13 populations residing in the County may be at greater health risk attributable to fish contamination  
14 because of their fish consumption practices (California Department of Health Services 2004). These  
15 fish consumption trends may be similar in other areas of the Delta.

16 Results of the interviews with Sacramento County community-based organizations and community  
17 members indicate that the African-American community eats fish regularly (once a week) that is  
18 caught locally or purchased in stores or restaurants (California Department of Health Services  
19 2004). The sportfish that are caught include catfish, bass, crappie, sturgeon, and carp (California  
20 Department of Health Services 2004).

21 Southeast Asians, particularly Vietnamese and Cambodians, fish regularly in Delta water bodies  
22 (California Department of Health Services 2004; Miller 2007). Representatives of a San Joaquin  
23 County Southeast Asian community-based organization have indicated that they believe that 80–  
24 90% of Southeast Asians residing in the County catch and/or eat fish caught in Delta water bodies  
25 (California Department of Health Services 2004). Cambodians, Lao, Hmong, and Vietnamese are  
26 reportedly the groups that most often fish. Locally harvested clams are eaten during summer. Many  
27 Asians also purchase fish and shellfish from door-to-door vendors or at Asian farmers' markets.  
28 These recreation and consumption patterns may be similar to those in other Delta counties.

29 Fish and fishing provide links to traditional fishing and use of the Mekong Delta for Cambodians  
30 (Miller 2007), and fish is the main source of food for Delta Cambodian communities (Bowman  
31 2008). Fish and shellfish caught locally and consumed regularly (two to three times per week) by  
32 the Cambodian community in San Joaquin County include catfish, striped bass, bluegill, salmon,  
33 crawfish, and trout (California Department of Health Services 2004). In addition, many Cambodians  
34 reportedly eat locally caught catfish daily (California Department of Health Services 2004).  
35 Awareness of the health risks associated with consumption of contaminated fish appears to be low  
36 in the Cambodian community in San Joaquin County. For example, Cambodian-speaking participants  
37 in a 2003 focus group held in Stockton indicated that they were not aware of these health risks  
38 (California Department of Health Services 2004). These subsistence trends for Cambodian residents  
39 of San Joaquin County may be similar to those in other areas of the Delta.

40 The San Joaquin County Vietnamese community eats fish and shellfish regularly (approximately two  
41 to three times per week) (California Department of Health Services 2004). Striped bass and catfish  
42 are caught locally and consumed by the Vietnamese community.

43 Although limited data exist for subsistence fishing by NHPI Delta residents, in a study of fish  
44 consumption practices by low-income minority groups in the Delta, Silver et al. (2007) found that

1 fish consumption by this minority group was relatively high. Specifically, Vietnamese, other Asians  
 2 and Pacific Islanders (which included all Asians except for Hmong, Cambodian, Vietnamese, and  
 3 Filipina participants), and African-American participants had the highest fish consumption rates,  
 4 and white and Native American participants the lowest (Silver et al. 2007).

5 Pomo Indian Tribes eat fish, caught by themselves or someone they know, from nearby water  
 6 bodies, such as Clear Lake and the Sacramento River, and many local tribe members eat catfish,  
 7 crayfish, bass, salmon, trout, and hitch from local water bodies regularly (California Department of  
 8 Health Services 2004).

9 The results of a focus group conducted in Spanish with representatives of a community-based  
 10 organization indicate that many Delta Latinos eat fish regularly (at least once a week) that they  
 11 catch in local water bodies (including the Delta) or buy in local markets (California Department of  
 12 Health Services 2004). The sportfish caught include striped bass, catfish, and sturgeon. According to  
 13 the focus group, the frequency of fish consumption among local Latinos depends on the agricultural  
 14 season and Latinos' work schedules (California Department of Health Services 2004). Focus group  
 15 participants also indicated that they believe Latinos are generally unaware of the Delta sportfish  
 16 health advisory and have little concern about mercury contamination in fish but some concern about  
 17 pesticide contamination.

## 18 **28.2.2 Low-Income Populations**

19 Figure 28-2 shows the distribution of areas with meaningfully greater proportions of low-income  
 20 households in the study area. Low-income populations were identified based on the Federal poverty  
 21 threshold in 2010 as defined by the U.S. Census Bureau (U.S. Census Bureau 2011: 61). The following  
 22 section describes the distribution of low-income populations in the study area. Sacramento has two  
 23 distinct areas with a high concentration of low-income residents. One is located east of I-5 near  
 24 Meadowview Road; the other population is located on the northwest side of downtown near Pioneer  
 25 Memorial Bridge and Jibboom Street, between the downtown rail yards and the American River.  
 26 There are also areas of low-income populations in the pocket area of Sacramento. Much of  
 27 neighboring West Sacramento also has high proportions of low-income residents, especially in the  
 28 areas north of I-80. These data were generated based upon census block groups identified as having  
 29 meaningfully greater low-income populations, in Appendix 28A, *Census Data*, Table 28A-3.

30 South of Sacramento, Mokelumne City and Thornton are also considered low-income areas, as well  
 31 as much of the surrounding rural, agricultural area.

32 Stockton has a number of low-income clusters, with low-income residents located near downtown  
 33 and Weber Point, along North Pacific Avenue, as well as to the north near March Lane, Benjamin  
 34 Holt Drive, and Hammer Lane, and to the south of the Port of Stockton, and on the north side of  
 35 French Camp Slough. French Camp also has a population of low-income residents west of I-5.  
 36 Lathrop has a population of low-income residents east of I-5, although much of this low-income  
 37 population is technically located outside of the Delta.

38 Identifiable clusters of low-income populations are in Tracy to the east of Tracy Boulevard, and to  
 39 the north of Valpico Road. Low-income populations are also located along the SR 4 Corridor in  
 40 Brentwood, Oakley, Antioch, and Pittsburg. The most widespread area of low-income residents is in  
 41 the interior Delta among the islands and tracts northwest of Holt. These populations are located on  
 42 Victoria Island, Woodward Island, Bacon Island, Jones Tract, McDonald Island, Mandeville Island,  
 43 Wright Tract, Rindge Tract, and the various small islands in between.

1 These areas are generally sparsely populated, but the populations on these islands are considered to  
 2 be low-income. These residents are anticipated to be tied socially and economically to the larger  
 3 nearby urban areas on the periphery of the Delta including Tracy, Stockton, and the urban centers in  
 4 the western end of the Delta because nearby urban centers are expected to provide employment  
 5 opportunities, goods, services, and entertainment otherwise unavailable in rural agricultural areas.  
 6 Multigenerational families may also have extended family members residing in nearby urban  
 7 centers.

8 Appendix 28A, *Census Data*, Table 28A-3, identifies census block groups that meet the meaningfully  
 9 greater threshold for low income (20% or more of the population meets the 2010 poverty  
 10 threshold). These data were used to generate Figure 28-2 and to identify the distribution of low-  
 11 income populations in the study area. This table also compares the average earnings of the  
 12 population in each of these block groups, to the average income for the relevant County. These two  
 13 data sets (the block group and County-based averages) provide a means of comparing the relative  
 14 earning of the block group to income trends in the region. With the exception of a small agricultural  
 15 population in San Joaquin County west of French Camp, average income estimates among low-  
 16 income Delta residents are lower than the County averages. Appendix 28A, *Census Data*, Table 28A-  
 17 3, thus provides a means of showing the relative poverty of the census block groups that meet the  
 18 meaningfully greater threshold, and supports the use of the 20% threshold, which identifies a  
 19 greater number of relatively impoverished populations than the typical 50% threshold would  
 20 reveal.

### 21 **28.2.2.1 Patterns of Employment for Low-income Populations**

22 In general, populations in low-income clusters in the Delta have a smaller proportion of residents in  
 23 the labor force (approximately 51%) compared with the Delta counties, which range from around  
 24 59% in San Joaquin County to nearly 65% in Contra Costa County. In addition, the unemployment  
 25 rate among the civilian labor force for those households in low-income clusters is substantially  
 26 higher than what is present in the surrounding counties (approximately 20%, compared with  
 27 between 4 and 10% for the counties).

28 Of those residents employed in the low-income areas, employment in the service occupations is  
 29 typically higher than in the surrounding counties, with approximately 20% of the population in low-  
 30 income clusters in the field. Additionally, occupations in production and transportation are of a  
 31 higher proportion for the low-income population (approximately 18%) compared with the  
 32 proportions seen in the surrounding counties. Finally, occupations in farming, fishing, and forestry  
 33 are elevated for low-income populations (approximately 4%), although this proportion is similar to  
 34 the level seen in San Joaquin County as a whole.

35 Overall, the distribution of employment for the low-income Delta population by industry is similar  
 36 to the distribution seen for the surrounding counties, with the proportions for low-income Delta  
 37 populations within the range seen across the counties. This is generally true for industries such as  
 38 manufacturing, wholesale trade, retail trade, transportation, and information management.

39 A slightly higher proportion of low-income residents are employed in the arts, entertainment,  
 40 recreation, accommodation, and food service industries (approximately 10%) than in the  
 41 surrounding counties. A higher proportion is also present in construction (approximately 8%) and  
 42 other services (approximately 5%). The class of worker in low-income populations in the Delta

1 is typically similar to the distribution seen among the surrounding counties, although there is a  
2 slightly smaller proportion of self-employed workers (approximately 5.3%).

3 The lifestyles of low-income residents in the Delta range from rural, agricultural lifestyles in the  
4 interior of the Delta to urban lifestyles in the surrounding cities of Sacramento, Stockton, Tracy,  
5 Antioch, and Pittsburg. As described above, a high proportion of low-income residents of the  
6 Delta work in the service fields, including food service. A high proportion of low-income Delta  
7 residents also work in agriculture, including seasonal agriculture.

## 8 **28.3 Public Outreach**

9 Public outreach is central to the principles of environmental justice, and an important component of  
10 meeting the goals identified in EO 12898. As Reclamation’s NEPA Handbook states, “scoping and  
11 public involvement activities should be carried out to ensure adequate opportunity for minority and  
12 low-income populations in the affected area to participate in the NEPA process. The participation of  
13 these groups can be particularly important when assessing the significance of impacts and the  
14 adequacy of contemplated mitigation measures.”

15 The EIR/EIS lead agencies conducted a total of 22 public scoping meetings throughout California  
16 during 2008 and 2009. A summary of the public scoping activities and an overview of comments  
17 received during the public scoping process are provided in Section 32.1.1. During these scoping  
18 meetings and other outreach efforts conducted in 2010, various concerns regarding potential effects  
19 on specific racial and ethnic minorities were expressed by members of the public. These concerns  
20 were generally associated with potential effects on important cultural landmarks, cultural practices  
21 (e.g., subsistence activities), and community character (California Department of Water Resources  
22 2010). The Environmental Justice Community Survey Summary Report prepared for the BDCP (and  
23 conducted by the Delta Habitat Conservation and Conveyance Program [DHCCP]) summarizes the  
24 2010 outreach effort that involved soliciting and compiling information provided by respondent  
25 members of minority groups regarding cultural significant practices as well as subsistence activity  
26 (California Department of Water Resources 2010). The results of this survey effort are described in  
27 Section 28.2.2.

28 Chapter 32, *Public Involvement, Consultation, and Coordination* provides a summary of the public  
29 involvement and outreach activities conducted for the BDCP EIR/EIS, contains information  
30 regarding the federal and state agencies that are participating in the CEQA and NEPA processes  
31 leading to the development of the Draft EIR/EIS for the BDCP, and a summary of some of the public  
32 involvement, consultation, and coordination activities conducted as part of the larger BDCP program  
33 independent of any EIR/EIS process.

34 The following summary of outreach activities and strategies, consistent with EO 12898 and the  
35 obligations described under Section 28.4, *Regulatory Setting*, of this chapter, including Reclamation’s  
36 NEPA guidance in the Draft NEPA Handbook requirements, presents how scoping and other  
37 outreach considered minority and low-income populations. These activities included the following.

- 38 ● Providing notification and announcements of scoping meetings in ethnic newspapers on ethnic  
39 radio stations.
- 40 ● Conducting scoping meetings within affected communities during evening hours in an effort to  
41 involve low-income and minority communities outside of working hours.

- 1 • Providing translators at public scoping meetings.
  - 2 • Providing the BDCP Website in Spanish.
  - 3 • Providing a multi-lingual information hotline for project information in English, Spanish,
  - 4 Tagalog, Vietnamese, or Chinese (Mandarin).
- 5 As discussed in Chapter 32, *Public Involvement, Consultation, and Coordination* describes outreach
- 6 efforts and coordination for the project.

## 7 **28.4 Regulatory Setting**

### 8 **28.4.1 Federal Plans, Policies, and Regulations**

#### 9 **28.4.1.1 Executive Order 12898**

10 EO 12898 (Section 1-101) requires federal agencies to identify and address any disproportionate

11 environmental or health impacts that federal actions or programs create on minority and low-

12 income populations. Two specific provisions of EO 12898 provide further guidance to federal

13 agencies. Section 1-103 requires that each federal agency develop an agency-specific environmental

14 justice strategy defining how the agency will identify disproportionate adverse effects on minority

15 and low-income populations and attempt to avoid those effects. Section 2-2 requires that federal

16 agencies perform their actions and programs in a manner that neither excludes minority and low-

17 income populations from relevant participation in the action or program nor denies those groups

18 the benefits of the action.

#### 19 **28.4.1.2 Council on Environmental Quality Guidance (1997)**

20 Council on Environmental Quality guidance (Council on Environmental Quality 1997) for

21 performing environmental justice analyses as part of the NEPA process provides definitions,

22 thresholds, and overall methodological guidance for environmental justice analyses. Please refer to

23 the Methods for Analysis section below for an overview of the CEQ guidance used in this analysis.

#### 24 **28.4.1.3 Environmental Compliance Memorandum No. ECM 95-3**

25 Memorandum No. ECM 95-3 provides guidance for complying with EO 12898 for U.S. Department of

26 the Interior actions and programs (U.S. Department of the Interior 1995a). It stipulates that

27 environmental documents prepared by U.S. Department of the Interior agencies shall analyze the

28 impact of agency actions on minority and low-income populations. The memorandum directs

29 agencies to evaluate the equity of the impacts imposed on these populations relative to the benefit of

30 the action. The relevant environmental document should identify any such impacts, or the absence

31 of impacts, on minority and low-income populations.

#### 32 **28.4.1.4 U.S. Department of the Interior**

##### 33 **Environmental Justice Strategic Plan – 1995**

34 EO 12898 requires federal agencies to develop agency-specific environmental justice plans. The U.S.

35 Department of the Interior (DOI or Department) has adopted a plan that governs the actions of all

1 agencies within the DOI, including the Bureau of Reclamation, and the U.S. Fish and Wildlife Service  
 2 (USFWS). The U.S. Department of the Interior Environmental Justice Strategic Plan – 1995 provides  
 3 the following goals (1995b).

- 4 • **Goal 1:** The Department will involve minority and low-income communities as we make  
 5 environmental decisions and assure public access to our environmental information.
- 6 • **Goal 2:** The Department will provide its employees environmental justice guidance and with the  
 7 help of minority and low-income communities develop training which will reduce their  
 8 exposure to environmental health and safety hazards.
- 9 • **Goal 3:** The Department will use and expand its science, research, and data collection  
 10 capabilities on innovative solutions to environmental justice-related issues (for example,  
 11 assisting in the identification of different consumption patterns of populations who rely  
 12 principally on fish and/or wildlife for subsistence).
- 13 • **Goal 4:** The Department will use our public partnership opportunities with environmental and  
 14 grassroots groups, business, academic, labor organizations, and federal, Tribal, and local  
 15 governments to advance environmental justice.

16 This plan is identified by Reclamation as the relevant policy that governs analysis of environmental  
 17 justice for agency actions (Bureau of Reclamation 2010). The plan in turn reflects the DOI's early  
 18 guidance implementing EO 12898 (U.S. Department of the Interior 1995a). This guidance indicates  
 19 that agencies within DOI should identify the effects of agency actions on minority and low-income  
 20 communities and analyze the equity of the distribution of benefits and risks of agency actions, as  
 21 described above (U.S. Department of the Interior 1995a). As an agency under DOI, USFWS subject to  
 22 this policy, and also refers to the text of EO 12898 in its NEPA guidance (U.S. Fish and Wildlife  
 23 Service 1999:35).

## 24 **Bureau of Reclamation, Draft NEPA Handbook**

25 Reclamation's NEPA guidance in the Draft NEPA Handbook affirms Reclamation's duty to consider  
 26 environmental justice as part of the NEPA process. The Draft NEPA Handbook indicates that the  
 27 affected environment should identify potentially affected minority and low-income communities. If  
 28 the potential for effects on minority or low-income populations is present, the environmental justice  
 29 assessment should include the following (Bureau of Reclamation 2012:32).

- 30 • A discussion of the composition of the demographic compositions of the affected area.
- 31 • A description of relevant existing conditions related to environmental and health effects.
- 32 • Analysis of the potential for interrelated cultural, social, occupational, historical or economic  
 33 factors that could amplify the effects of the proposed action.
- 34 • A discussion of how scoping or other outreach can ensure adequate participation of minority  
 35 and low-income populations.
- 36 • Identification of data on the general population for purposes of comparison to determine if  
 37 effects on minority and low-income populations are disproportionate.

### 28.4.1.5 National Oceanic and Atmospheric Administration, National Marine Fisheries Service

The *National Oceanic and Atmospheric Administration Procedures for Implementing NEPA* provides guidance on compliance with EO 12898 in the agency administrative order discussing NEPA compliance (NAO 216-6):

- Consideration of EO 12898 should be included in NOAA NEPA documentation for decision making purposes.
- The analysis of effects provided for compliance with NEPA should include consideration of health, economic, and social effects on minority and low-income communities.
- Mitigation measures should address significant or adverse effects on minority or low-income communities.

## 28.4.2 State Plans, Policies, and Regulations

### 28.4.2.1 California Senate Bill 115 (Solis)

Approved in 1999, California Senate Bill 115 (Solis) added Section 65040.12 to the Government Code and Part 3 to Division 34 of the Public Resources Code, both of which concern environmental justice. The bill provides that the Office of Planning and Research is the coordinating agency in California state government for environmental justice programs. The bill also defines environmental justice as “the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws and policies.”

### 28.4.2.2 California Government Code Section 65040.12

For the purposes of Government Code Section 65040.12, environmental justice is defined as “the fair treatment of people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies.”

Section 65040.12 requires the Office of Planning and Research to take the following actions.

1. Consult with the Secretaries of the California Environmental Protection Agency, the Resources Agency, and the Business, Transportation and Housing Agency, the Working Group on Environmental Justice established pursuant to Section 72002 of the Public Resources Code, any other appropriate state agencies, and all other interested members of the public and private sectors in this state.
2. Coordinate the office’s efforts and share information regarding environmental justice programs with the Council on Environmental Quality, the United States Environmental Protection Agency, the General Accounting Office, the Office of Management and Budget, and other federal agencies.
3. Review and evaluate any information from federal agencies that is obtained as a result of their respective regulatory activities under federal EO 12898, and from the Working Group on Environmental Justice established pursuant to Section 72002 of the Public Resources Code.

Section 65040.12 also requires the Office of Planning and Research to establish guidelines for addressing environmental justice issues in city and county general plans, including planning methods for the equitable distribution of public facilities and services, industrial land uses, and the promotion of more livable communities.

### 28.4.2.3 Public Resources Code Sections 71110–71116

Public Resources Code Sections 71110–71116 require the California Environmental Protection Agency to develop a model environmental justice mission statement for boards, departments, and offices in the agency. Section 71113 requires the California Environmental Protection Agency to convene a Working Group in Environmental Justice to develop a comprehensive environmental justice strategy. The sections also require this strategy to be reviewed and updated. Finally, Section 71116 establishes a small grant program for nonprofit organizations and federally recognized tribal entities to research environmental justice issues in their community and address larger environmental justice issues.

### 28.4.2.4 California Resources Agency

The California Resources Agency’s environmental justice policy (California Resources Agency 2003) also applies to DWR. This policy implements the requirements of California Government Code Section 65040.12 for California Resources Agency actions and programs. The policy states that these provisions apply to agency actions, which are defined as (California Resources Agency 2003:2) follows.

- Adopting regulations.
- Enforcing environmental laws or regulations.
- Making discretionary decisions or taking actions that affect the environment.
- Providing funding for activities affecting the environment.
- Interacting with the public on environmental issues.

The policy states that these goals shall be implemented through the following means:

- Identifying relevant populations that might be adversely affected by programs or projects submitted by outside parties, as appropriate.
- Seeking out and consulting with community groups and leaders to encourage communication and collaboration prior to taking actions that may have an impact on the environment, environmental laws or policies.
- Broadly distributing public information, in multiple languages if appropriate, to encourage participation in public processes.
- Ensuring that public documents and notices relating to environmental issues that may have an impact on human health are concise, understandable, and readily accessible to the public, printed in multiple languages if appropriate.
- Holding required public meetings, hearings, and workshops at times and in locations that encourage meaningful public participation by members of affected communities.
- Working in conjunction with other federal, state, regional, and local agencies to ensure consideration of disproportionate impacts on relevant populations.
- Fostering broad access to existing and proposed data sets and technology to better identify, analyze, and respond to environmental justice issues.
- Providing appropriate training to staff on environmental justice issues so that recognition and consideration of such issues are incorporated into daily program activities.

1 Collectively, these policies stand for the principle that California State agencies should analyze the  
 2 effects of their actions on minority and low-income groups, and seek to avoid disproportionate  
 3 effects on these groups where feasible. This chapter analyzes the compatibility of the BDCP with  
 4 these policies, as described below under Section 28.5.3, *Effects and Mitigation Approaches*.

#### 5 **28.4.2.5 Environmental Justice Compliance and Enforcement Working Group**

6 The California Environmental Protection Agency created the Environmental Justice Compliance and  
 7 Enforcement Working Group in 2013. The working group coordinates compliance and enforcement  
 8 of state environmental laws in California communities that are most affected by pollution. Members  
 9 include the enforcement chiefs from CalEPA, the Department of Toxic Substances Control, the  
 10 Department of Pesticide Regulation, CalRecycle, the Air Resources Board and the State Water  
 11 Resources Control Board, as well as a representative from the Office of Environmental Health  
 12 Hazard Assessment.

## 13 **28.5 Environmental Consequences**

### 14 **28.5.1 Methods for Analysis**

15 The following subsection describes how disproportionately high and adverse effects on  
 16 environmental justice populations were identified. This methodology follows the general guidance  
 17 provided by EO 12898, *Federal Actions to Address Environmental Justice in Minority and Low-Income*  
 18 *Populations*, CEQ's *Environmental Justice: Guidance under the National Environmental Policy Act*  
 19 *(Council on Environmental Quality 1997)*, and EPA's *Toolkit for Assessing Potential Allegations of*  
 20 *Environmental Injustice* (U.S. Environmental Protection Agency 2004).

21 The EPA's *Toolkit for Assessing Potential Allegations of Environmental Injustice* is a conceptual and  
 22 substantive framework for understanding the Agency's environmental justice program. The Toolkit  
 23 provides research tools and a systematic approach to assess and respond to potential allegations of  
 24 environmental injustice as they occur, or to prevent injustices from occurring in the first place. This  
 25 guidance also sets forth various indicators and tiered phases for performing an environmental  
 26 justice analysis. This document is oriented to identifying vulnerable communities and the stressors  
 27 that may adversely impact these communities. The Toolkit acknowledges the potential usefulness of  
 28 various techniques to identify the communities or population potentially affected by a government  
 29 action. A "Proximity Analysis" may be conducted where the exposure to a contaminant is correlated  
 30 with distance from the source of the contaminant. The Toolkit also notes that a more refined  
 31 analysis might include using a GIS platform to provide a spatial overlay of the location of various  
 32 sources and the total mass of contaminants released with the location of community residences.

33 This subsection first describes the relevant definitions that govern the analysis of environmental  
 34 justice effects, and then follows with a description of the methodology used to identify minority and  
 35 low-income populations as well as disproportionately high effects on minority and low-income  
 36 communities associated with the alternatives.

### 28.5.1.1 Definitions

The following definitions were used to identify relevant populations and guide analysis of environmental justice issues. These definitions come from the CEQ guidance and EPA *Toolkit for Assessing Potential Allegations of Environmental Injustice*.

**Minorities:** Environmental justice guidance from CEQ defines minority persons as “individuals who are members of the following population groups: American Indian or Alaskan Native; Asian or Pacific Islander; Black (not of Hispanic origin); or Hispanic” (Council on Environmental Quality 1997:25). Hispanic or Latino refers to a place of origin whereas American Indian, Alaskan Native, Asian, Pacific Islander, and Black or African-American (as well as White or European-American) refer to racial categories; thus, for census purposes, individuals classify themselves into racial categories as well as place of origin categories, including Hispanic/Latino and non-Hispanic/Latino. The U.S. Census 2010 allowed individuals to choose more than one race. For this analysis, consistent with guidance from CEQ and EPA (U.S. Environmental Protection Agency 2004:25), minority refers to people who are Hispanic/Latino of any race, as well as those who are non-Hispanic/Latino of a race other than White or European-American.

**Low-income:** The CEQ environmental justice guidance (Council on Environmental Quality 1997:25) suggests low-income populations be identified using the national poverty thresholds from the U.S. Census Bureau.

**Reference populations:** The EPA *Toolkit for Assessing Potential Allegations of Environmental Injustice* identifies the concept of a reference population. A reference population consists of a sample of the general population in a community, state, or other appropriate geographic unit used to compare the severity of effects in an environmental justice population relative to the general population. The reference population provides a benchmark for determining if the relative incidence of particular health effects in an environmental justice population significantly exceed the typical incidence of those health effects. Where the incidence in the environmental justice population significantly exceeds the incidence in the reference population there may be a disproportionately high and adverse effect in the environmental justice population. For purposes of this assessment, the reference population is generally the study area.

**Disproportionately high and adverse effects:** For the purposes of this assessment disproportionately high and adverse effects are defined per the CEQ environmental justice guidance. Health effects are disproportionately high and adverse if they are significant and exceed or are likely exceed the risk to the general population or other appropriate reference population. Health effects are also disproportionately high and adverse if they would disproportionately affect a minority or low-income population through multiple or cumulative exposures to a population (Council on Environmental Quality 1997:26).

Environmental effects are disproportionately high and adverse if they are adverse under NEPA and disproportionately affect a minority or low-income community as described below. For geographically discrete environmental effects such as noise effects, the demographics of the affected population were analyzed. Where minority or low-income individuals constitute a meaningfully greater population, a disproportionately high and adverse finding is made.

## 28.5.1.2 Overview of Methods

The EPA *Toolkit for Assessing Potential Allegations of Environmental Injustice* (U.S. Environmental Protection Agency 2004) provides a general roadmap and methodology for the assessment of environmental justice effects. Per this guidance, environmental justice effects are identified in a phased process with the following steps.

**Problem Formulation:** During this phase, agencies should identify the scope of the action or program that may have environmental justice consequences and integrate the environmental justice assessment with parallel environmental review processes (U.S. Environmental Protection Agency 2004:20).

For this chapter, the scope of the problem subject to analysis consists of the action alternatives that involve proposed water conveyance facilities and other conservation measures described in Chapter 3, *Description of Alternatives*, Section 3.3. The proposed water conveyance facilities (Conservation Measure 1 [CM1]) are evaluated at a project level while the other conservation measures (CM2–CM22) are evaluated at a program level.

**Data Collection:** During this phase the agency should collect information about sources of environmental or health effects in environmental justice populations and identify minority and low-income groups as well as appropriate reference populations (U.S. Environmental Protection Agency 2004:20).

In Section 28.2, *Environmental Setting/Affected Environment*, of this chapter, information about the distribution of environmental justice populations in the study area is presented. Detailed demographic data was collected for the minority and low-income populations as defined in the CEQ guidance, above, from the U.S. Census Bureau website. Low-income data was collected for each census block group, and minority data was collected for each census block within the study area.

**Identification of Adverse Effects:** During this phase the agency identifies significant environmental and health effects associated with the agency action or program that may affect environmental justice populations (U.S. Environmental Protection Agency 2004:20).

- This environmental justice assessment is limited to effects that have been identified as adverse even with mitigation. These effects were then carried forward and screened for their potential to result in disproportionate adverse effects on environmental justice populations. For effects that were determined not adverse, no additional evaluation is needed because those effects would not result in disproportionate effects on minority and low-income populations. This method of screening effects is consistent with the CEQ guidance (Council on Environmental Quality 1997:25). Effects identified as adverse, even after mitigation was considered, are analyzed in this chapter to determine if they would result in a disproportionately high and adverse effect on an environmental justice population, as described below.
- **Identification of Disproportionate Effects:** During this phase of the assessment the agency screens significant effects identified for other resources to determine if any of these environmental consequences may disproportionately affect an environmental justice population (U.S. Environmental Protection Agency 2004:21). Environmental effects are disproportionate if they are adverse under NEPA, and occur in census blocks with greater than 50% total minority or Hispanic populations (minorities or minority populations) or in census block groups where low-income individuals (i.e., below the 2010 poverty threshold) are greater than 20%. Where effects are identified as adverse under NEPA, this analysis further identifies whether the adverse

1 effects would result in disproportionately high and adverse effects on minority or low-income  
 2 populations. This chapter analyzes effects that would remain adverse after mitigation, which  
 3 also have the potential to result in effects on discernible and discrete concentrations of  
 4 meaningfully greater minority and low-income populations.

## 5 **28.5.2 Determination of Effects**

6 CEQ guidance provides relevant thresholds for identification of environmental justice effects. As  
 7 described above, the CEQ guidance identifies three factors to be considered to the extent practicable  
 8 when determining whether environmental effects are disproportionately high and adverse (Council  
 9 on Environmental Quality 1997:26–27).

- 10 • Whether there is or would be an effect on the natural or physical environment that adversely  
 11 affects a minority population, or low-income population. Such effects may include ecological,  
 12 cultural, human health, economic, or social effects on minority communities, low-income  
 13 communities, or Indian tribes when those effects are interrelated to effects on the natural or  
 14 physical environment. For the purposes of this analysis an adverse effect on a minority  
 15 population is found where environmental effects would occur in a location where minorities  
 16 constitute greater than 50% of the population or low-income individuals constitute 20% or  
 17 more of the population.
- 18 • Whether the environmental effects may have an adverse effect on minority populations, or low-  
 19 income populations, which appreciably exceeds or is likely to appreciably exceed those on the  
 20 general population or other appropriate comparison group. For the purposes of this analysis an  
 21 effect appreciably exceeds the effect on the general population if it would occur in a location  
 22 where minorities constitute greater than 50% of the population or low-income individuals  
 23 constitute 20% or more of the population.
- 24 • Whether the environmental effects occur or would occur in a minority population or low-  
 25 income population affected by cumulative or multiple adverse exposures from environmental  
 26 hazards that appreciably exceed the cumulative or adverse exposure of the population at large.  
 27 For the purposes of this analysis an effect appreciably exceeds the effect on the general  
 28 population if the affected population is greater than 50% minority or 20% or greater low-  
 29 income.

30 These standards are consistent with the standards of the California Resources Agency  
 31 Environmental Justice Policy. This policy states that the Resources Agency and the constituent  
 32 departments shall (California Resources Agency 2003:2) undertake the following.

- 33 • Identify relevant populations that might be adversely affected by programs or projects  
 34 submitted by outside parties, as appropriate.
- 35 • Work in conjunction with other federal, state, regional, and local agencies to ensure  
 36 consideration of disproportionate impacts on relevant populations.

## 28.5.3 Effects and Mitigation Approaches

### 28.5.3.1 Issues Not Analyzed in Detail

#### Effects Outside the Plan Area

##### *Upstream of the Delta*

Effects upstream of the Delta will be limited to the incidental changes in reservoir levels associated with the selected operational scenario, as described in Chapter 3, *Description of Alternatives*, Section 3.6.4.2. Current modeling shows that the operational scenarios have a minimal effect on upstream reservoir levels, and that precipitation and inflow are much stronger drivers of reservoir levels. Because operational changes will result in few, if any, physical effects on the environment, these operational changes are not analyzed for their potential to result in disproportionate adverse effects on minority or low-income populations.

##### *SWP/CVP Export Service Areas*

Alternatives 1A, 1B, 1C, 2A, 2B, 2C, 3, 4, 5, and 9 are expected to increase water supply reliability in the export service areas. Overall, this would have beneficial effects on water supply conditions in these regions, with associated benefits for constituent populations that consume water or that work in water consumptive industries (i.e., agriculture-related industries), and economic security for those industries that rely on water. Therefore, these action alternatives are not anticipated to have direct, physical effects in the SWP/CVP Export Service Areas that would disproportionately affect minority or low-income populations. There would be beneficial effects on the population at large in the export service areas that cannot be reduced to discrete benefits for any particular segment of the population.

The economic effects of the reduced export alternatives (Alternatives 6A, 6B, 6C, 7, and 8) are described in Chapter 30, *Growth Inducement and Other Indirect Effects*, Section 30.3.2, and in Chapter 16, *Socioeconomics*, Section 16.3.3. These effects may include economic effects on water-consumptive industries such as agriculture, and associated employment opportunities. To the extent that the burden of such an impact would fall upon minority or low-income populations, a disproportionately high and adverse effect may occur. Appendix 5B, *Responses to Reduced South of Delta Water Supplies*, describes various mechanisms by which recipients of Delta water supplies could respond, based on alternative water supplies, conservation, and other approaches. Regional and local responses would depend on local conditions (for example, availability of groundwater), the duration of any reduction in supply, and on individual decision-makers including landowners and elected officials. Because the magnitude, timing, and location of reductions in supply is unknown, it is uncertain whether a disproportionately high and adverse effect would result from implementation of those BDCP alternatives that would reduce exports from the Delta.

##### *Environmental Justice Impacts of Delivery Reliability*

Increased water delivery reliability could result in beneficial impacts on minority or low income communities. These beneficial impacts could occur in areas where a large proportion of economic activity is dependent on agricultural production and in which the agricultural labor force is primarily composed of minority or low income workers. Minority populations of counties within San Joaquin Valley and the Tulare Basin are estimated to range from 54% in Stanislaus County to 68% in Tulare County (Aguirre International 2005). In addition, an estimated 99 percent of agricultural-

1 related employment within the San Joaquin Valley and Tulare Basin is composed of minority or low  
 2 income workers (Aguirre International 2005). Increased water delivery reliability to San Joaquin  
 3 Valley and Tulare Basin would result in stabilization of employment opportunities. Because  
 4 agricultural-related employment within the San Joaquin Valley and Tulare Basin is predominantly  
 5 composed of low income and minority workers, the increase in reliability of water deliveries could  
 6 result in a beneficial effect on these worker's employment and income levels.

7 Conversely, reductions in water deliveries could result in a disproportionate impact on minority or  
 8 low income communities. As with increased delivery reliability, reductions in deliveries could occur  
 9 in areas where a large proportion of economic activity is dependent on agricultural production and  
 10 in which the agricultural labor force is primarily composed of minority or low income workers.  
 11 Reducing exports to the San Joaquin Valley and Tulare Basin would result in reduced deliveries to  
 12 agricultural users and associated reduction in employment opportunities. Because agricultural-  
 13 related employment within the San Joaquin Valley and Tulare Basin is predominantly composed of  
 14 low income and minority workers, the reduction in water deliveries could result in an adverse effect  
 15 to these worker's employment and income levels.

16 Water deliveries to southern California are made to a broad range of municipal and industrial users.  
 17 The broad range of uses makes it difficult to determine if there would be either a beneficial effect on  
 18 minority or low income workers if water deliveries were to increase in reliability or a  
 19 disproportionate adverse effect if water deliveries were to decrease. However, similar to conditions  
 20 in the San Joaquin Valley and Tulare Basin, increased water delivery reliability would be expected to  
 21 stabilize employment and income levels within the delivery areas. Conversely, reductions in  
 22 deliveries would be expected to result in an adverse effect on employment and income within the  
 23 delivery areas.

## 24 **Resource Topics**

25 The following resource chapters either did not identify any adverse effects, or adverse effects were  
 26 not relevant to environmental justice populations. Typical effects associated with geology and  
 27 seismicity are not adverse and thus would not contribute to disproportionate impacts on  
 28 environmental justice populations. An adverse effect related to hazards has to do with the potential  
 29 for bird-aircraft strikes in the vicinity of airports. Adverse effects on mineral resources are related to  
 30 potential loss of access to resource extraction sites and loss of availability of locally important  
 31 natural gas wells as a result of implementing Conservation Measures 2-22. Those impacts are not  
 32 expected to disproportionately affect minority and low-income populations. The socioeconomic  
 33 effects resulting from the loss of natural gas wells are discussed in Chapter 16, *Socioeconomics*,  
 34 Section 16.3.3.2. Therefore they were not carried forward in this environmental justice assessment.

- 35 ● Chapter 9, *Geology and Seismicity*
- 36 ● Chapter 24, *Hazards and Hazardous Materials*
- 37 ● Chapter 26, *Mineral Resources*

38 The following resource topics identified adverse effects, but were not carried forward for detailed  
 39 analysis in this environmental justice assessment for other reasons. Some of these chapters were  
 40 excluded because the effects identified in the relevant chapters do not have the potential to affect  
 41 minority and low-income populations. For example, Chapter 14, *Agricultural Resources*, Sections  
 42 14.3.3.2 through 14.3.3.16, address conversion of farmland and the reduction in land available for  
 43 cultivation and constraints on crop types. This information was used in the socioeconomic

1 assessment (Chapter 16, *Socioeconomics*, Sections 16.3.3.2 through 16.3.3.16) to estimate changes in  
2 agricultural-related employment for each alternative. This socioeconomic effect is analyzed in this  
3 environmental justice analysis, whereas effects identified in Chapter 14, *Agricultural Resources*,  
4 Sections 14.3.3.2 through 14.3.3.16, are not analyzed in detail. The following discussion describes  
5 the reasons specific resource topics were not analyzed in greater detail.

## 6 **Water Supply**

7 Chapter 5, *Water Supply*, Sections 5.3.3.2 through 5.3.3.16, analyze the potential for the action  
8 alternatives to alter patterns of water delivery and water supply reliability both north and south of  
9 the study area. The chapter analyzes changes in delivery patterns and reliability for both  
10 agricultural and municipal and industrial users that receive water from the SWP and CVP. Changes  
11 in water delivery or reliability would not directly result in effects on environmental justice  
12 populations because water supply changes alone would not be adverse without considering the  
13 secondary socioeconomic effects that could potentially result from such a reduction. Most of the  
14 BDCP action alternatives (except Alternatives 6A, 6B, 6C, 7, and 8) would increase average annual  
15 water supply deliveries south of the Delta and water supply reliability. For those alternatives that  
16 would result in average annual reductions in SWP and CVP deliveries south of the Delta, potential  
17 disproportionate effects on environmental justice populations are referenced in the *Socioeconomics*  
18 sections below. Also, see Chapter 30, *Growth Inducement and Other Indirect Effects*, for discussion on  
19 any indirect impacts on export service areas. Changes to water supply alone would not result in  
20 environmental effects that could disproportionately affect environmental justice populations. For  
21 these reasons, effects in this chapter are not carried forward for environmental justice analysis.

## 22 **Surface Water**

23 Chapter 6, *Surface Water*, Sections 6.3.3.2 through 6.3.3.16, analyze the potential effects of the action  
24 alternatives on surface water resources within the Delta, areas upstream of the Delta, and portions  
25 of the SWP and CVP Export Service Areas that could be directly affected by implementation of the  
26 action alternatives. The surface waters analyzed in Chapter 6, *Surface Water*, Sections 6.3.3.2  
27 through 6.3.3.16, include Sacramento River upstream of the Delta and downstream of Keswick Dam,  
28 Trinity River downstream of Lewiston Reservoir, Feather River downstream of Thermalito Dam,  
29 American River downstream of Nimbus Dam, surface water diversions into Yolo Bypass,  
30 representative Delta channels, and San Joaquin River upstream of the Delta. Of the impact  
31 mechanisms discussed in Chapter 6, *Surface Water*, Impact SW-7, *Expose people or structures to a*  
32 *significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of*  
33 *a levee or dam due to the construction and operation of new conveyance facilities*, was reviewed to  
34 determine the potential for effects on environmental justice populations.

35 As described in detail in Chapter 6, *Surface Water*, Sections 6.3.3.2 through 6.3.3.16, under Impact  
36 SW-7, the action alternatives would not result in an increase in exposure of people or structures to  
37 flooding due to construction or operations of the conveyance facilities or construction of the habitat  
38 restoration facilities because the facilities would be required to comply with the requirements of the  
39 U.S. Army Corps of Engineers, Central Valley Flood Protection Board, and DWR to avoid increased  
40 flood potential. Consequently, this effect is not carried forward in this environmental justice  
41 analysis.

**1 Groundwater**

2 Chapter 7, *Groundwater*, Sections 7.3.3.2 through 7.3.3.16, analyze the potential for construction and  
3 long-term operational conditions to result in effects on groundwater resources in lands adjacent to  
4 the proposed conveyance facilities. Chapter 7, *Groundwater*, Sections 7.3.3.2 through 7.3.3.16, also  
5 analyze the potential for changes in patterns of conjunctive use (rotating use of groundwater and  
6 surface water) in the export service areas. The action alternatives would generally improve patterns  
7 of conjunctive use and the potential for groundwater overdraft by increasing surface water  
8 reliability in the export service areas. Effects on local groundwater resources and increased use of  
9 surface water in export areas would not result in a disproportionate effect on environmental justice  
10 populations because local groundwater changes and effects on wells adjacent to dewatering areas  
11 would be mitigated and groundwater changes in export areas would be beneficial. Therefore, these  
12 effects are not carried forward for analysis.

**13 Water Quality**

14 Chapter 8, *Water Quality*, analyzes the effects of the BDCP alternatives on water quality within the  
15 study area defined for that chapter. Where these effects are relevant to public health issues, they are  
16 carried forward for analysis in this chapter. Relevant impacts from Chapter 25, *Public Health*, are  
17 analyzed in detail.

**18 Soils**

19 Chapter 10, *Soils*, Sections 10.3.3.2 through 10.3.3.16, examine the potential effects of soil erosion,  
20 loss of topsoil, land subsidence, and corrosive, expansive, or compressible soils. The loss of topsoil  
21 would be adverse. Though the loss of topsoil may reduce the quality or quantity of agricultural lands  
22 available for cultivation and may result in an indirect effect on agricultural employment, it would  
23 not directly result in effects on environmental justice populations. However, Chapter 16,  
24 *Socioeconomics*, Sections 16.3.3.2 through 16.3.3.16, Impact ECON-1, estimates changes in  
25 agriculture-related employment, including agricultural jobs, as a result of the action alternatives and  
26 those changes in agriculture-related employment are discussed in this chapter. Effects on soils are  
27 not carried forward for environmental justice analysis.

**28 Fish and Aquatic Resources**

29 Chapter 11, *Fish and Aquatic Resources*, Sections 11.3.4.2 through 11.3.4.16, examine the effect that  
30 construction of conveyance features and implementation of conservation measures may have on fish  
31 and the aquatic environment. Effects on fish and aquatic resources would not directly result in  
32 effects on environmental justice populations. Indirect public health effects, such as the potential for  
33 increased uptake of methylmercury in target species of fish pursued by subsistence fishermen in the  
34 Delta, are examined in Chapter 25, *Public Health*, Sections 25.3.3.2 through 25.3.3.16, Impacts PH-3  
35 and PH-7. The BDCP alternatives are not expected to create conditions that would substantially  
36 increase bioaccumulation of methylmercury or pesticides in Delta fish species. Therefore no public  
37 health issues related to subsistence fishing on environmental justice populations would occur.

**38 Terrestrial Biological Resources**

39 Chapter 12, *Terrestrial Biological Resources*, Sections 12.3.3.2 through 12.3.3.16, analyze the effect  
40 that construction of conveyance alternatives and conservation measures would have on natural

1 communities and habitats, covered species, and non-covered species. Effects on these resources  
2 would not result in direct or discernible indirect effects on environmental justice populations.

### 3 **Agricultural Resources**

4 Chapter 14, *Agricultural Resources*, Sections 14.3.3.2 through 14.3.3.16, identify numerous adverse  
5 effects associated with the construction of conveyance facilities and implementation of restoration.  
6 Specific adverse effects examined include the conversion of important farmland, conversion of  
7 farmland under Williamson Act contracts, and constraints on crop selection, as a result of  
8 construction of the proposed water conveyance facilities and implementation of the conservation  
9 measures. The reduction in land available for cultivation and constraints on crop types may reduce  
10 agricultural employment opportunities. The agricultural work force has a high proportion of  
11 minority and low-income workers, therefore effects on these employment opportunities may be  
12 adverse for purposes of environmental justice. Since the effects addressed in Chapter 14,  
13 *Agricultural Resources*, Sections 14.3.3.2 through 14.3.3.16 (e.g., conversion of important farmland  
14 and constraints on crop selection) would not directly affect minority and low-income populations,  
15 but may result in indirect effects on the agricultural economy, effects on agricultural land and crop  
16 types are not carried forward for environmental justice analysis. However, Chapter 16,  
17 *Socioeconomics*, Sections 16.3.3.2 through 16.3.3.16, Impact ECON-1, estimates changes in  
18 employment including agricultural jobs, and those changes in employment are addressed in this  
19 chapter. The assessment of potential effects on minority and low-income populations as a result of  
20 changes in employment is addressed below.

### 21 **Recreation**

22 Chapter 15, *Recreation*, Sections 15.3.3.2 through 15.3.3.16, analyze the potential for the  
23 construction of the proposed water conveyance facilities and conservation measures to reduce  
24 recreational opportunities, interrupt recreational activities, degrade recreational facilities, or  
25 conflict with recreational policies. Chapter 15, *Recreation*, Sections 15.3.3.2 through 15.3.3.16,  
26 identify temporary effects on recreational facilities and opportunities, and temporary alteration of  
27 recreational boat navigation. It also identifies the potential for permanent alteration of recreational  
28 boat navigation. While effects on particular facilities or recreational navigational routes may be  
29 adverse, the action alternatives are not expected to have an effect on the overall availability of  
30 water-based recreational opportunities in the study area because of the scale of the Delta in relation  
31 to the project. Impacts on recreational facilities and opportunities are not carried forward for  
32 environmental justice analysis because adequate alternative recreational opportunities and facilities  
33 exist in the Delta, therefore temporary loss of particular facilities will not result in a  
34 disproportionate effect on environmental justice populations.

35 Chapter 15, *Recreation*, Sections 15.3.3.2 through 15.3.3.16, identify potential impacts on specific  
36 recreational facilities where fishing occurs under Impact REC-2 and associated recreational fishing  
37 under Impact REC-4. Affected facilities where construction noise may temporarily diminish the  
38 quality of fishing include the Clarksburg Boat Launch (fishing access), the Georgiana Slough Fishing  
39 Access, Clifton Court Forebay, Cliffhouse Fishing Access, Delta Meadows River Park, Westgate  
40 Landing Park, and Brannan and Sherman Islands. The number of fishing access sites that would  
41 actually be affected would be limited to sites specific to the selected action alternative. For each  
42 alternative, at least some fishing venues and levee access points would be temporarily disrupted.  
43 Subsistence fishing in the Delta region is a significant activity among minority and low-income

1 populations (Shilling et al. 2010:2). However shoreline fishing opportunities occur throughout the  
2 Delta region, in each of the five zones identified in a study performed by the California Department  
3 of Parks and Recreation (Delta Protection Commission 1997). In addition, the entire Sacramento  
4 River corridor is used for fishing, as described by Shilling et al. (2010:2). For example, fishermen  
5 intensely utilize the banks of the Sacramento River in the Pocket Area, north of the intakes for the  
6 tunnel and canal options (Shilling et al. 2010:2). While the action alternatives would affect  
7 subsistence fishing at the specific locations identified in Chapter 15, *Recreation*, the construction of  
8 conveyance facilities is not expected to inhibit subsistence fishing overall. Because the Delta region  
9 contains an abundance of fishing locations generally (Delta Protection Commission 1997), and  
10 alternative locations near the action alternatives specifically are available (Shilling et al. 2010:2), the  
11 impacts described in Chapter 15, *Recreation*, Sections 15.3.3.2 through 15.3.3.16, would not  
12 significantly diminish the overall availability of opportunities for subsistence fishermen. Alternative  
13 fishing venues and levee access points would remain open under all action alternatives.

14 Chapter 15, *Recreation*, Sections 15.3.3.2 through 15.3.3.16, Impact REC-1, identifies some  
15 permanent effects on recreational facilities that would result from the action alternatives. However,  
16 because substantial alternative venues exist this would not result in substantial effects on minority  
17 or low-income populations. Please refer the analysis of cumulative effects in Chapter 15, *Recreation*,  
18 Section 15.3.4, for a discussion of the alternative recreational opportunities in the Delta and their  
19 relationship to permanently affected facilities.

## 20 **Transportation**

21 Chapter 19, *Transportation*, analyzes the effects on traffic systems and patterns of traffic circulation.  
22 Because these effects are not adverse with mitigation, these effects are not carried forward for  
23 detailed analysis in this chapter. Prior to construction, the BDCP proponents would be responsible  
24 for implementing a site-specific construction traffic management plan, as described under  
25 Mitigation Measure TRANS-1a in Chapter 19, *Transportation*, which would mitigate potential  
26 adverse traffic-related effects on low-income or minority populations in the project area.

## 27 **Energy**

28 Chapter 21, *Energy*, Sections 21.3.3.2 through 21.3.3.16, analyze the potential for the construction  
29 and operation of conveyance facilities to increase energy demand temporarily or permanently.  
30 Increases in energy demand associated with the conveyance facilities alone, would not result in  
31 discernible effects on discrete and identifiable environmental justice populations because the  
32 production and delivery of electrical power occurs on a regional or even national level, so localized  
33 increases in demand cannot be traced to effects on particular populations.

## 34 **Paleontological Resources**

35 Chapter 27, *Paleontological Resources*, Sections 27.3.3.2 through 27.3.3.16, analyze the potential for  
36 the construction of conveyance facilities and conservation measures to adversely affect fossils and  
37 other paleontological resources that may be scientifically important or of interest to the public.  
38 Effects on paleontological resources would not result in effects on environmental justice populations  
39 because the loss of paleontological resources would be of significance to the population at large.

## 1      **Air Quality and Greenhouse Gases**

2      Chapter 22, *Air Quality and Greenhouse Gases*, examines the potential for the action alternatives to  
 3      increase greenhouse gas emissions and contribute to climate change. The relationship between  
 4      effects associated with climate change and environmental justice is discussed below in Section  
 5      28.5.4.

6      Chapter 22 also examines the potential for criteria pollutants, such as reactive organic gases (ROG)  
 7      and nitrogen oxides (NO<sub>x</sub>), to exceed local and federal air quality management district thresholds. As  
 8      described in Chapter 22, *Air Quality and Greenhouse Gases*, Section 22.1.2, ROG and NO<sub>x</sub> are  
 9      considered regional pollutants because they affect air quality on a regional scale. They may have an  
 10     impact on the project area, but it cannot be determined that it would amount to a disproportionate  
 11     impact to low income and minority populations in specific locations. Therefore, effects from ROG  
 12     and NO<sub>x</sub> are not analyzed in this chapter.

## 13     **Public Health**

14     Chapter 25, *Public Health*, Sections 25.3.3.2 through 25.3.3.16, Impact PH-7 identifies the potential  
 15     for future conservation measures to increase methylation of mercury as a result of the creation of  
 16     new habitat and natural communities in the study area. This effect is specifically associated with  
 17     implementation of CM4 (tidal wetland habitat), CM5 (floodplain habitat), CM10 (freshwater marsh  
 18     habitat), and possibly CM 2 (Yolo Bypass fisheries enhancements). These measures could create  
 19     conditions resulting in increased methylation of mercury within the Delta per unit time, increased  
 20     biotic exposure to and uptake of methylmercury, and result in increased mercury bioaccumulation  
 21     in fish tissues. These measures would be implemented alongside CM12 *Methylmercury Management*,  
 22     which would seek to manage and reduce methylmercury mobilization levels in the Delta. In addition,  
 23     existing OEHHA standards would reduce the public's exposure to mercury-contaminated fish.  
 24     Because these future conservation measures have not been refined with the level of detail  
 25     associated with a project-level action, the precise potential for increases in methylmercury  
 26     associated with these actions cannot currently be described, and analyzed for potential  
 27     environmental justice effects. Project-level increases in the bioaccumulation of mercury in Delta fish  
 28     species associated with specific alternatives are analyzed in this chapter.

## 29     **28.5.4      No Action Alternative**

30     The No Action Alternative includes continued implementation of SWP/CVP operations,  
 31     maintenance, enforcement, and protection programs by federal, state, and local agencies and  
 32     nonprofit groups, as well as projects that are permitted or are assumed to be constructed by 2060.  
 33     Climate change that would occur with or without the BDCP is also part of the No Action Alternative.  
 34     A complete list and description of programs, plans, and other assumptions considered under the No  
 35     Action Alternative is provided in Appendix 3D, *Defining Existing Conditions, No Action Alternative, No*  
 36     *Project Alternative, and Cumulative Impact Conditions*. These actions are limited to Existing  
 37     Conditions and programs adopted during the early stages of development of the EIR/EIS, facilities  
 38     that are permitted or under construction during the early stages of development of the EIR/EIS, and  
 39     foreseeable changes in development that would occur with or without the BDCP. Many of the  
 40     ongoing projects and programs in the Delta could have potential consequences for minority and  
 41     low-income populations.

42     As shown in Figures 28-1 and 28-2, minority and low-income populations are distributed across the  
 43     study area. The study area is therefore sensitive for environmental justice effects because adverse

1 environmental effects associated with actions in this area have the potential to disproportionately  
2 affect these populations, based on their distribution and presence throughout the study area. For  
3 example, highly localized construction effects, such as emissions of toxic air contaminants or diesel  
4 particulate matter (DPM) during construction of individual development projects, levee repair, or  
5 restoration projects, may occur where there is a high concentration of minority and low-income  
6 populations. The Central Valley is also generally sensitive for environmental justice effects, as  
7 program-level environmental review for regional projects demonstrate (Bureau of Reclamation  
8 2011a:9-4).

#### 9 **28.5.4.1 SWP/CVP Operations**

10 As described in Appendix 3D, *Defining Existing Conditions, No Action Alternative, No Project*  
11 *Alternative, and Cumulative Impact Conditions*, SWP/CVP operations identified as continuing actions  
12 under the No Action Alternative include repair, maintenance, or protection of imperiled  
13 infrastructure such as levees, and may also include actions for water quality management, habitat  
14 and species protection, or flood management. These actions could result in adverse effects such as  
15 displacement of residents or homes as a result of right of way acquisition, construction noise effects  
16 on noise sensitive land uses, or emissions of air quality pollutants proximate to sensitive receptors,  
17 which may affect local populations in the study area. Depending on the spatial distribution of these  
18 effects, minority or low-income populations could be disproportionately affected. Because the  
19 precise location of maintenance, repair, and rehabilitation of facilities is not known, the affected  
20 environmental justice populations cannot be identified with certainty. The general economic effects  
21 of reduced export alternatives (6A, 6B, 6C, 7, and 8) on south-of-Delta areas are described in Chapter  
22 30, *Growth Inducement and Other Indirect Effects*, Section 30.3.2.3. A summary of the environmental  
23 justice effects associated with ongoing plans, policies, and programs in the Delta is provided below.

#### 24 **28.5.4.2 Ongoing Plans, Policies, and Programs**

25 A number of the programs, plans and policies that would be implemented in or near the study area  
26 under the No Action Alternative are summarized in Table 28-1. Environmental review for these  
27 projects provides an indication of the kinds of environmental justice effects that would result in the  
28 absence of the BDCP, where such project-level review has been performed. For a full description of  
29 conditions under the No Action Alternative, see Appendix 3D, *Defining Existing Conditions, No Action*  
30 *Alternative, No Project Alternative, and Cumulative Impact Conditions*.

31 Environmental review for some programs that would be implemented under the No-Action  
32 Alternative, summarized in Table 28-1, has identified the potential for disproportionate effects on  
33 minority and low-income groups. For example, the San Joaquin River Restoration Program may have  
34 disproportionate effects on minority and low-income populations under both action alternatives  
35 and the no action conditions (Bureau of Reclamation 2011a:9-26). These effects would be associated  
36 with reduced traffic circulation and roadway capacity, emissions of toxic air contaminants,  
37 construction noise, and loss of agricultural sector jobs.

1 **Table 28-1. Plans, Policies, and Programs for the No Action Alternative that May Affect Minority and**  
 2 **Low-income Populations**

Agency	Program/ Project	Status	Description of Program/ Project	Potential Effects on Minority and Low-Income Populations
Bureau of Reclamation, U.S. Fish and Wildlife Service, National Marine Fisheries Service, California Department of Water Resources and California Department of Fish and Wildlife	San Joaquin River Restoration Program	Ongoing	The program would implement a comprehensive long-term effort to restore flows to the San Joaquin River from Friant Dam to the confluence of Merced River and restore a self-sustaining Chinook salmon fishery in the river. There are many physical improvements within and near the San Joaquin River that will be undertaken to fully achieve the river restoration goal.	The program will include numerous individual projects such as levee repairs or upgrades to accommodate channel restoration and enhancement along the San Joaquin River. Landside irrigation and drainage facilities may also have to be moved. Collectively these new facilities and improvement may displace adjacent residences and have localized construction effects such as congestion associated with truck traffic, localized air quality effects, and construction noise. Minority and low-income populations may be disproportionately affected if they constitute the majority of the population in the vicinity.
Sacramento Area Flood Control Agency	Natomas Levee Improvement Program, Landside Improvements Project	Ongoing	The program addresses levee vulnerabilities for the Sacramento River East Levee along the west side of the Natomas Basin.	Project-level analysis demonstrates that levee repairs may affect prehistoric cultural resources resulting in a potentially disproportionate effect on environmental justice populations.
Bureau of Reclamation and Contra Costa Water District	Los Vaqueros Reservoir Expansion Project	Environmental review complete.	The proposed expansion project would increase the reservoir capacity, add a connection to South Bay water agencies, Alameda County Flood Control and Water Conservation District, Zone 7, Alameda County Water District, and Santa Clara Valley Water District, and result in construction of a new diversion on Old River.	No disproportionate effect because no meaningfully greater minority or low-income populations occur near the proposed expansion project activities.
Bureau of Reclamation	Suisun Marsh Habitat Management Preservation and Restoration Plan	Ongoing	The Suisun Marsh Plan would result in tidal marsh restoration, creation of managed marshes, and levee repairs.	No disproportionate effect because no meaningfully greater minority or low-income populations occur near the proposed restoration activities.
NMFS/USFWS	2008 and 2009 Biological Opinion	Ongoing	The Biological Opinions issued by NMFS and USFWS establish RPAs to be implemented. Some of the RPAs require habitat restoration which may require changes to existing levees and channel improvements.	No disproportionate effect because no meaningfully greater minority or low-income populations occur near the proposed restoration activities

3

1 The Sacramento Area Flood Control Agency (SAFCA) has identified a potentially disproportionate  
2 effect on Native American populations resulting from adverse effects on prehistoric cultural  
3 resources, because these resources have cultural significance for these populations and levee  
4 repairs would disturb these resources (EDAW/AECOM 2009:4.21-2). SAFCA concludes that this  
5 effect would be avoided with mitigation that increases benefits to Native Americans (EDAW/AECOM  
6 2009:4.21-3).

7 By contrast, environmental review for restoration projects often identifies no effect on  
8 environmental justice populations. The Suisun Marsh Habitat Management, Preservation and  
9 Restoration Plan would not result in any adverse effects on environmental justice populations  
10 because no meaningfully greater minority or low-income populations occur near proposed activities  
11 (Bureau of Reclamation 2011b: 7.9-1).

12 Environmental review for water resources management projects that would be implemented in the  
13 absence of the BDCP often identify no disproportionate effect on environmental justice populations.  
14 This is because affected communities do not contain meaningfully greater minority or low-income  
15 groups. For example, the construction of the Los Vaqueros Reservoir expansion and associated new  
16 conveyance facilities would not result in disproportionate effects on environmental justice  
17 populations because meaningfully greater populations do not occur in the relevant affected  
18 environment (Bureau of Reclamation 2009:4.18-15, 4.18-16).

19 Large regional programs that result in numerous construction projects are likely to result in the  
20 most significant contribution to environmental justice effects, because of the scale and duration of  
21 such programs. Many of these programs are currently in the planning stage and have not been  
22 carried forward for environmental review. For example, the Central Valley Flood Protection Plan  
23 consists of a planning framework that will guide necessary levee repairs and associated  
24 improvements throughout the Sacramento and San Joaquin Valleys (Appendix 3D, *Defining Existing*  
25 *Conditions, No Action Alternative, No Project Alternative, and Cumulative Impact Conditions*). The  
26 presence of numerous meaningfully greater minority and low-income populations in the study area  
27 indicates that the region is sensitive for environmental justice effects. Similarly, implementation of  
28 the USFWS 2008 Biological Opinion requiring restoration of 8,000 acres of tidal habitat, could result  
29 in adverse effects related to losses in agricultural employment, with a disproportional effect on  
30 minority or low-income populations. Depending on the location of such restoration, increased noise,  
31 traffic, or emissions related to construction activities necessary for implementing tidal habitat  
32 restoration could disproportionately affect minority or low-income populations. However, because  
33 these populations occur in discrete locations, absent specific project-level plans for these programs,  
34 it is not possible to calculate the contribution these larger plans would make to effects on minority  
35 and low-income groups.

36 In the absence of environmental review for these large programs, the No Action analysis for other  
37 environmental resources covered in this document provides some indication of the environmental  
38 effects that may contribute to disproportionate effects on minority and low-income populations. For  
39 example, even in the absence of the BDCP, existing and approved projects would result in the  
40 conversion of farmland in the study area (see Chapter 14, *Agricultural Resources*, Section 14.3.3.1,  
41 Table 14-7). These projects would permanently convert approximately 230 acres of farmland and  
42 temporarily affect an additional 500 acres of farmland. Because a very high proportion of California  
43 farm laborers are Hispanic (approximately 99%), the conversion of agricultural land would result in  
44 a disproportionate loss of jobs among Hispanic laborers working in the agricultural sector (Aguirre  
45 International 2005:10). While construction labor demands associated with some of these projects

1 may result in a net benefit to local economies, agricultural laborers may not be able to transition  
 2 directly to these jobs. For these reasons, conversion of agricultural land may result in a  
 3 disproportionate effect on minorities.

4 Chapter 18, *Cultural Resources*, Section 18.3.5.1, Table 18-1, identifies the potential for adverse  
 5 effects on prehistoric cultural resources under the No Action alternative because the set of plans and  
 6 projects that would be implemented in the absence of the BDCP will disturb such resources. Because  
 7 prehistoric cultural resources have special significance for Native American populations, these  
 8 effects would contribute to a disproportionate effect on minority groups.

9 As concluded in the environmental review for some of the projects that would be implemented  
 10 under the No Action Alternative, these projects would contribute to a disproportionate effect on  
 11 minority and low-income populations. In addition, environmental effects identified in this EIR/EIS  
 12 that would result under the No Action conditions would also contribute to disproportionate effects.  
 13 For example, conversion of agricultural land within the study area may affect minority populations  
 14 that provide farm labor, and loss of cultural resources may affect minority populations that attach  
 15 significance to these resources. Collectively, these conditions result in an adverse effect.

## 16 **Climate Change and Catastrophic Seismic Risks**

17 The Delta and vicinity are within a highly active seismic area, with a generally high potential for  
 18 major future earthquake events along nearby and/or regional faults, and with the probability for  
 19 such events increasing over time. Based on the location, extent and non-engineered nature of many  
 20 existing levee structures in the Delta area, the potential for significant damage to, or failure of, these  
 21 structures during a major local seismic event is generally moderate to high. For major earthquakes  
 22 along larger faults, ground rupture can extend for considerable distances (hundreds or thousands of  
 23 feet). (See Appendix 3E, *Potential Seismic and Climate Change Risks to SWP/CVP Water Supplies*, for  
 24 more detailed discussion) In instances of a catastrophic event due to climate change or a seismic  
 25 event, there would also be a potential for adverse effect to a range of resource areas, some of which  
 26 could result in a disproportionately adverse effect on minority or low-income populations, depending  
 27 on the location or nature of such effects. Effects on agricultural employment following a catastrophic  
 28 event would likely fall disproportionately on minority and low-income populations. Reclaiming land  
 29 or rebuilding levees after a catastrophic event due to climate change or a seismic event would  
 30 potentially occur near minority or low-income populations, potentially introducing adverse effects  
 31 related to noise, traffic, or emissions. Such construction activities, along with the potential  
 32 inundation caused by flooding as a result of a catastrophic event, could also disturb historic or  
 33 prehistoric cultural resources that would affect minority populations that attach significance to  
 34 these resources.

## 35 **28.5.5 Alternative 1A—Dual Conveyance with Pipeline/Tunnel** 36 **and Intakes 1–5 (15,000 cfs; Operational Scenario A)**

37 This section analyzes the environmental justice effects of the resource topics that are carried  
 38 forward for detailed analysis for Alternative 1A. Relevant environmental justice effects associated  
 39 with adverse effects identified in these resource chapters are analyzed to determine if they would  
 40 result in a disproportionate effect on minority or low-income populations. Figures 28-1 and 28-2  
 41 show the distribution of minority and low-income populations in relation to the pipeline/tunnel  
 42 alignment, which includes Alternative 1A.

### 1 28.5.5.1 Land Use

2 Chapter 13, *Land Use*, Section 13.3.3.2, identifies effects caused by incompatibility with land use  
 3 policies, incompatibility with local land uses, and potential for physical division of established  
 4 communities. By itself, incompatibility with land use policies is not a physical effect on the  
 5 environment, and, therefore, does not have the potential to result in a disproportionate effect on a  
 6 minority or low-income population. Chapter 13, *Land Use*, Section 13.3.3.2, also addresses the  
 7 potential for a BDCP alternative to result in the relocation of residents, or a physical effect on  
 8 existing structures, with the consequence that adverse effects on the physical environment would  
 9 result. The following adverse effects are relevant to this analysis.

#### 10 **Impact LU-2: Conflicts with Existing Land Uses as a Result of Constructing the Proposed** 11 **Water Conveyance Facility (CM1)**

#### 12 **Impact LU-3: Create Physical Structures Adjacent to and through a Portion of an Existing** 13 **Community as a Result of Constructing the Proposed Water Conveyance Facility (CM1)**

14 Under Alternative 1A, approximately 204 permanent structures would be removed or relocated  
 15 within the water conveyance facilities footprint, including an estimated 59 residential buildings. The  
 16 analysis of physical effects on structures in Chapter 13, *Land Use*, Section 13.3.3.2, indicates that the  
 17 physical footprints of the intake facilities and their associated conveyance pipelines would be  
 18 anticipated to create the largest disruption to structures. Chapter 13, *Land Use*, Section 13.3.3.2,  
 19 Table 13-4, summarizes the estimated number of structures affected across structure type and  
 20 alternative, and Mapbook Figure M13-1 shows the distribution of these effects across the  
 21 pipeline/tunnel conveyance alignment.

22 As shown in Figures 28-1 and 28-2, there are census blocks with a meaningfully greater minority  
 23 population (more than 50%) and block groups with low-income populations throughout the study  
 24 area, and specifically along the pipeline/tunnel alignment. Because construction of Intakes 1–5  
 25 would result in the displacement of approximately 59 residential structures, which would affect  
 26 census blocks where the minority population is greater than 50%, this would represent a  
 27 disproportionate effect on minority populations. When required, DWR would provide compensation  
 28 to property owners for property losses due to implementation of the alternative. This compensation  
 29 would reduce the severity of economic effects related to this physical effect but would not reduce  
 30 the severity of the physical effect itself. For these reasons, conflicts with existing land uses as a result  
 31 of constructing the proposed water conveyance facility (CM1) would be an adverse effect.

32 In addition, Chapter 13, *Land Use*, Section 13.3.3.2, examines the potential to divide existing  
 33 communities. During the construction of the conveyance pipeline between Intake 3 and the  
 34 intermediate forebay (about 0.5 mile north and south of Hood, respectively), construction activities  
 35 would bisect the community of Hood, separating some of the community's easternmost structures  
 36 from the main section of the community. Even though access to and from the community would be  
 37 maintained over the long-term, the placement of Intake 4 and its associated facilities, as well as the  
 38 nearby construction of Intake 3 and the intermediate forebay, would create lasting physical barriers  
 39 between Hood and the surrounding lands. While a permanent physical division within the  
 40 community itself is not anticipated to result from these features, activities associated with their  
 41 construction would create divisions over a multiyear period. Mitigation Measures TRANS-1a and  
 42 TRANS-1b, which would require the development and implementation of a site-specific traffic  
 43 management plan, and limit construction activity on congested roadway segments, are available to

1 address this effect. However, these divisions and physical barriers between the community of Hood  
2 and its surroundings constitute an adverse effect.

3 As shown in Figures 28-1 and 28-2, the community of Hood is composed of both census blocks with  
4 a meaningfully greater minority population (more than 50%) and block groups with low-income  
5 populations. Consequently, the division of the community of Hood would have disproportionately  
6 adverse effects on minority and low-income populations in Hood because this division would occur  
7 in a community with a meaningfully greater minority population. This would be an adverse effect.

## 8 **28.5.5.2 Socioeconomics**

9 Chapter 16, *Socioeconomics*, Section 16.3.3.2, identifies effects on agricultural economics and local  
10 employment conditions associated with construction, operations, and conservation measures. These  
11 impacts have the potential to disproportionately affect environmental justice populations. Other  
12 effects in Chapter 16, *Socioeconomics*, Section 16.3.3.2 are not analyzed in this section because they  
13 either relate to program-level conservation measures that do not have sufficient project-level detail  
14 to identify environmental justice consequences, or because they do not have the potential to  
15 disproportionately affect environmental justice populations. The following effects are analyzed in  
16 this section:

### 17 **Impact ECON-1: Temporary Effects on Regional Economics in the Delta Region during** 18 **Construction of the Proposed Water Conveyance Facilities**

### 19 **Impact ECON-7: Permanent Regional Economic Effects in the Delta Region during Operation** 20 **and Maintenance of the Proposed Water Conveyance Facilities**

21 The general economic effects of reduced export alternatives (6A, 6B, 6C, 7, and 8) on areas south of  
22 the Delta are described in Chapter 30, *Growth Inducement and Other Indirect Effects*, Section 30.3.2.  
23 As described in Chapter 16, *Socioeconomics*, Section 16.3.3.2, Impact ECON-1, construction of the  
24 water conveyance facilities would increase total employment and income in the study area. The  
25 change would result from expenditures on construction and from changes in agricultural  
26 production. Changes in jobs in the study area as a result of Alternative 1A construction are reported  
27 in Chapter 16, *Socioeconomics*, Section 16.3.3.2, Table 16-19. During the peak construction years, it  
28 is estimated that 4,390 jobs (direct) and 12,716 jobs total (direct, indirect, and induced effects)  
29 would be gained in the study area.

30 However construction of conveyance and related facilities, such as roads and utilities, would cause  
31 temporary and permanent conversion of agricultural land. Because construction would reduce  
32 agricultural land under cultivation, construction would result in the direct loss of 27 agricultural  
33 jobs/year and a total loss of 100 agricultural jobs/year (direct, indirect, and induced effects)  
34 (Chapter 16, *Socioeconomics*, Section 16.3.3.2, Table 16-20).

35 As described in Chapter 16, *Socioeconomics*, Section 16.3.3.2, Impact ECON-7, operation of  
36 conveyance facilities constructed under Alternative 1A would result in the direct creation of 187  
37 jobs/year and the creation of 269 jobs total (Chapter 16, *Socioeconomics*, Section 16.3.3.2, Table 16-  
38 22). However, because operations would reduce agricultural cultivation, operations would result in  
39 the direct loss of 31 agricultural jobs/year and a total of 86 agricultural jobs/year (including direct,  
40 indirect and induced effects) (Chapter 16, *Socioeconomics*, Section 16.3.3.2, Table 16-23).

1 Because of a combination of historical and recent settlement trends, many of the agricultural areas  
 2 in the interior Delta contain high proportions of minority residents, including Hispanics, Asians, and  
 3 African-Americans. According to the report *The California Farm Labor Force Overview and Trends*  
 4 *from the National Agricultural Workers Survey*, commissioned by the EPA Region 9 Pesticide  
 5 Program, which provides the most current demographic information collected through the National  
 6 Agriculture Worker Survey (NAWS), approximately 99% of California farm laborers are Hispanic  
 7 (Aguirre International 2005:10), and approximately 22% of farm labor falls below the poverty  
 8 threshold (Aguirre International 2005:27).

9 Because the majority of farm labor in the study area is minority, including those of Hispanic origin,  
 10 and potentially low-income, the loss of up to 100 agricultural jobs/year in the study area associated  
 11 with construction of the conveyance facilities is considered to be a disproportionate effect on an  
 12 environmental justice population. While a net increase in employment would result during  
 13 construction because of new construction jobs, these jobs would not likely be filled by displaced  
 14 agricultural workers because the skills required are not comparable. This effect would, therefore,  
 15 remain adverse because job losses would disproportionately accrue to minority populations.

### 16 **28.5.5.3 Aesthetics and Visual Resources**

17 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.2, addresses visual resources in the study  
 18 area, where proposed intake and water conveyance facilities and related structures and operations  
 19 would be located. Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.2, identifies the  
 20 following adverse effects.

#### 21 **Impact AES-1: Substantial Alteration in Existing Visual Quality or Character during** 22 **Construction of Conveyance Facilities**

#### 23 **Impact AES-2: Permanent Effects on a Scenic Vista from Presence of Conveyance Facilities**

#### 24 **Impact AES-3: Permanent Damage to Scenic Resources along a State Scenic Highway from** 25 **Construction of Conveyance Facilities**

#### 26 **Impact AES-4: Creation of a New Source of Light or Glare That Would Adversely Affect Views** 27 **in the Area as a Result of Construction and Operation of Conveyance Facilities**

#### 28 **Impact AES-6: Substantial Alteration in Existing Visual Quality or Character during** 29 **Implementation of CM2–CM22**

30 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.2, Impact AES-6, analyzes the effect of the  
 31 implementation of CM2–CM22 on aesthetic and visual resources. This impact is adverse. However  
 32 because the precise location of where future conservation measures will be implemented is  
 33 unknown, this impact is not carried forward for further analysis of environmental justice effects for  
 34 this alternative or other alternatives.

35 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.2, also identifies the following mitigation  
 36 measures that would reduce the identified effects on aesthetics and visual resources.

#### 37 **Mitigation Measure AES-1a: Locate New Transmission Lines and Access Routes to** 38 **Minimize the Removal of Trees and Shrubs and Pruning Needed to Accommodate New** 39 **Transmission Lines and Underground Transmission Lines Where Feasible**

1 **Mitigation Measure AES-1b: Install Visual Barriers between Construction Work Areas and**  
2 **Sensitive Receptors**

3 **Mitigation Measure AES-1c: Develop and Implement a Spoil/Borrow and Reusable Tunnel**  
4 **Material Area Management Plan**

5 **Mitigation Measure AES-1d: Restore Barge Unloading Facility Sites Once Decommissioned**

6 **Mitigation Measure AES-1e: Apply Aesthetic Design Treatments to All Structures to the**  
7 **Extent Feasible**

8 **Mitigation Measure AES-1f: Locate Concrete Batch Plants and Fuel Stations Away from**  
9 **Sensitive Visual Resources and Receptors and Restore Sites upon Removal of Facilities**

10 **Mitigation Measure AES-1g: Implement Best Management Practices to Implement Project**  
11 **Landscaping Plan**

12 **Mitigation Measure AES-4a: Limit Construction to Daylight Hours within 0.25 Mile of**  
13 **Residents**

14 **Mitigation Measure AES-4b: Minimize Fugitive Light from Portable Sources Used for**  
15 **Construction**

16 **Mitigation Measure AES-4c: Install Visual Barriers along Access Routes, Where Necessary,**  
17 **to Prevent Light Spill from Truck Headlights toward Residences**

18 **Mitigation Measure AES-6a: Underground New or Relocated Utility Lines Where Feasible**

19 **Mitigation Measure AES-6b: Develop and Implement an Afterhours Low-intensity and**  
20 **Lights off Policy**

21 **Mitigation Measure AES-6c: Implement a Comprehensive Visual Resources Management**  
22 **Plan for the Delta and Study Area**

23 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.2, Impacts AES-1 through AES-4, describe  
24 the aesthetics and visual resources effects associated with water conveyance facilities construction  
25 and operations. Impact AES-3 describes the effects on local scenic highways, such as SR 160.  
26 Because degradation of a scenic highway would result in loss of scenic qualities for all highway  
27 users, it is not carried forward for environmental justice analysis.

28 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.2, Impact AES-1, addresses the potential  
29 for construction activities to substantially alter the visual quality or character in the vicinity of  
30 project elements that can be viewed from local sensitive receptors and public viewing areas. The  
31 primary features that would affect the existing visual character under Alternative 1A once the  
32 facilities have been constructed would be Intakes 1–5, the intermediate forebay and Byron Tract  
33 Forebay, resulting landscape scars effects left behind from spoil/borrow and reusable tunnel  
34 material (RTM) areas, transmission lines, and concrete batch plants and fuel stations. Construction-  
35 related visual changes would be most evident in the northern portion of the study area, which would  
36 undergo extensive construction to build large industrial facilities and supporting infrastructure  
37 along and surrounding the 8.5-mile segment of the Sacramento River where the intakes would be

1 situated. The overall construction period would be 9 years, and the intensity of the activities in  
 2 contrast to the current rural/agricultural nature of the area would be substantial. The intermediate  
 3 forebay, Byron Tract Forebay and several of the work areas adjacent to the southern portion of the  
 4 conveyance alignment also would generate adverse visual effects for adjacent viewers, including  
 5 residents in the communities of Clarksburg, Walnut Grove, and Hood.

6 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.2, Impact AES-2, describes the permanent  
 7 alteration of scenic resources resulting from construction. As described in this impact, the primary  
 8 features that would affect scenic vistas subsequent to completion of construction of Alternative 1A  
 9 are Intakes 1–5, the intermediate forebay and Byron Tract Forebay, landscape scars remaining from  
 10 spoil/borrow and RTM areas, and transmission lines. The communities of Clarksburg, Walnut Grove,  
 11 and Hood would be affected.

12 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.2, Impact AES-4, describes the potential  
 13 for new sources of light and glare that would be introduced during construction or as part of  
 14 permanent features that would remain after the conveyance facilities are complete. Intakes 1–5 and  
 15 their associated pumping stations, surge towers, and facilities and the pumping plant at the  
 16 intermediate forebay would introduce new surfaces that may increase glare. In addition, the water  
 17 surfaces of the new forebays would reflect sunlight, introducing glare. Evening and nighttime  
 18 construction activities would require use of bright lights and generate increased nighttime  
 19 headlights flashing into nearby residents' homes; these light sources would affect adjacent  
 20 populations. New facilities would also require the use of safety lighting once built. Lighting  
 21 equipment associated with BDCP facilities would increase the amount of nighttime lighting along the  
 22 alignment above ambient light levels. In particular, security lighting for Intakes 1–5 and their  
 23 associated pumping stations and facilities would create very noticeable effects relating to increasing  
 24 nighttime light at those locations. The communities of Hood and Clarksburg would be affected.

25 While mitigation is available to reduce the effects of Impacts AES-1, AES-2, and AES-4, these effects  
 26 would remain adverse. As shown in Figures 28-1 and 28-2, meaningfully greater minority and low-  
 27 income populations occur throughout the study area, including along the pipeline/tunnel alignment.  
 28 Specifically, a concentration of minority and low-income populations are located in the communities  
 29 of Clarksburg, Walnut Grove, and Hood, where residential viewers in these communities would be  
 30 affected by adverse visual effects of this alternative.

31 Because adverse visual effects are largely associated with the northern portion of the alignment  
 32 where permanent features would remain and along the southern portion of the alignment where the  
 33 Byron Tract Forebay and borrow and spoil areas would be constructed, where minority and low-  
 34 income populations occur, these effects would disproportionately affect these populations. For these  
 35 reasons, although mitigation is available to reduce the severity of these effects, this effect would be  
 36 adverse because the geographic location of the effect contains meaningfully greater minority and  
 37 low-income populations.

#### 38 **28.5.5.4 Cultural Resources**

39 Construction of conveyance facilities under this alternative would have adverse effects on  
 40 prehistoric archaeological resources, unidentified human remains, historic archaeological sites,  
 41 traditional cultural properties, and built environment resources, as described in Chapter 18, *Cultural*  
 42 *Resources*, Section 18.3.5.2, Impact CUL-1 through Impact CUL-7.

1 **Impact CUL-1: Effects on Identified Archaeological Sites Resulting from Construction of**  
 2 **Conveyance Facilities**

3 **Impact CUL-2: Effects on Archaeological Sites to Be Identified through Future Inventory**  
 4 **Efforts**

5 **Impact CUL-3: Effects on Archaeological Sites That May Not Be Identified through Inventory**  
 6 **Efforts**

7 **Impact CUL-4: Effects on Buried Human Remains Damaged during Construction**

8 **Impact CUL-5: Direct and Indirect Effects on Eligible and Potentially Eligible Historic**  
 9 **Architectural/Built-Environment Resources Resulting from Construction Activities**

10 **Impact CUL-6: Direct and Indirect Effects on Unidentified and Unevaluated Historic**  
 11 **Architectural/Built-Environment Resources Resulting from Construction Activities**

12 **Impact CUL-7: Effects of Other Conservation Measures on Cultural Resources**

13 Chapter 18, *Cultural Resources*, Section 18.3.5.2, Impact CUL-8, addresses the compatibility of the  
 14 BDCP with the adopted cultural resource management policies of agencies with land use authority in  
 15 the Delta. Because this effect is not a physical environmental effect that could result in impacts on  
 16 environmental justice populations, it is not relevant to this analysis.

17 Ground-disturbing construction has the potential to damage both identified and previously  
 18 unrecorded examples of each of these resources. Mitigation measures are available to reduce these  
 19 effects.

20 **Mitigation Measure CUL-1: Prepare a Data Recovery Plan and Perform Data Recovery**  
 21 **Excavations on the Affected Portion of the Deposits of Identified and Significant**  
 22 **Archaeological Sites**

23 **Mitigation Measure CUL-2: Conduct inventory, Evaluation, and Treatment of**  
 24 **Archaeological Resources**

25 **Mitigation Measure CUL-3: Implement an Archaeological Cultural Resources Discovery**  
 26 **Plan, Perform Training of Construction Workers, and Conduct Construction Monitoring**

27 **Mitigation Measure CUL-4: Follow State and Federal Law Governing Human Remains If**  
 28 **Such Resources Are Discovered during Construction**

29 **Mitigation Measure CUL-5: Consult with Relevant Parties, Prepare and Implement a Built**  
 30 **Environment Treatment Plan**

31 **Mitigation Measure CUL-6: Conduct a Survey of inaccessible Properties to Assess**  
 32 **Eligibility, Determine If These Properties Will Be Adversely Impacted by the Project, and**  
 33 **Develop Treatment to Resolve or Mitigate Adverse Impacts**

1           **Mitigation Measure CUL-7: Conduct Cultural Resource Studies and Adopt Cultural**  
 2           **Resource Mitigation Measures for Cultural Resource Impacts Associated with**  
 3           **Implementation of Conservation Measures 2–22**

4           Prehistoric resources, especially sites containing human remains, are of special significance to the  
 5           Native American community. The geographic distribution of the affected resources is described in  
 6           Chapter 18, *Cultural Resources*, Section 18.3.5.2. The number of resources affected by each  
 7           alternative is indicated in the tables provided in Appendix 18B, *Identified Cultural Resources*  
 8           *Potentially Affected by BDCP Alternatives*. These resources represent a tangible link to the past, and,  
 9           if they contain human remains, a resting place for interred ancestors. While cultural resources and  
 10          buried human remains also contain significance for the general public (including low-income  
 11          populations), the significance to the general public is typically limited to the scientific value of the  
 12          resources. Because these resources are especially significant to Native American populations and  
 13          potentially other minority populations, adverse effects identified in Chapter 18, *Cultural Resources*,  
 14          Section 18.3.5.2, Impacts CUL-1 through CUL-7, would result in a disproportionate effect on  
 15          minorities. The affected population cannot always be identified with specificity because members of  
 16          tribes that attach significance to the resources in the Delta may reside in relatively remote locations  
 17          rather than in adjacent census blocks or even counties. Nonetheless, this alternative would result in  
 18          a disproportionate effect on Native American populations and potentially other minorities.

19          In addition to the mitigation measures proposed in this EIS/EIR, federal agencies that have a  
 20          significant role in implementing the BDCP are required to comply with Section 106 of the National  
 21          Historic Preservation Act (NHPA) (16 United States Code [USC] 470f). Section 106 and the Section  
 22          106 regulations require that the agencies identify effects on historic properties and consult with the  
 23          public (including relevant minority groups) and Native American tribes during the management  
 24          process. Section 106 thus adds another mechanism for identifying resources, and developing  
 25          mitigation that would reduce or avoid adverse effects. Despite these mitigation measures and  
 26          consultation processes, this alternative is likely to result in adverse effects on prehistoric  
 27          archaeological resources and human remains because the scale of the alternative makes avoidance  
 28          of all eligible resources infeasible. In addition, because there is no feasible way to identify buried  
 29          resources that may occur in deep subterranean sections of the tunnel in advance of construction,  
 30          effects on these resources cannot be accurately identified or avoided. The effect on minority  
 31          populations that may ascribe significance to cultural resources in the Delta would remain  
 32          disproportionate even after mitigation because mitigation cannot guarantee that all resources  
 33          would be avoided, or that effects on affected resources would be reduced. For these reasons this  
 34          effect would be adverse.

35          **28.5.5.5      Public Services and Utilities**

36          Chapter 20, *Public Services and Utilities*, Section 20.3.3.2, addresses the potential effects of the  
 37          alternative on utility infrastructure and public service providers, such as fire stations and police  
 38          facilities. Chapter 20, *Public Services and Utilities*, Section 20.3.3.2, identifies three adverse effects  
 39          under this alternative.

40          **Impact UT-2: Displacement of Public Service Facilities as a Result of Constructing the**  
 41          **Proposed Water Conveyance Facilities**

42          **Impact UT-6: Effects on Regional or Local Utilities as a Result of Constructing the Proposed**  
 43          **Water Conveyance Facilities**

1 **Impact UT-8: Effects on Public Services and Utilities as a Result of Implementing the**  
2 **Proposed CM2–CM11**

3 Chapter 20, *Public Services and Utilities*, Section 20.3.3.2, Impact UT-2, addresses the potential for  
4 the displacement of a public facility as a result of construction of the proposed conveyance facilities.  
5 As described in this impact, construction of the proposed water conveyance pipeline between Intake  
6 3 and the intermediate forebay would conflict with the Hood Fire Station, at 1125 Hood-Franklin  
7 Road in Hood. The Hood Fire Station is one of two fire stations within the Courtland Fire District.  
8 The other fire station, the Courtland Fire Station, is approximately 5 miles southwest of the Hood  
9 Fire Station at 154 Magnolia Avenue in Courtland, along SR 160, which is substantially older than  
10 the Hood Fire Station. The two Courtland Fire District fire stations serve a 33-square-mile area of  
11 Sacramento County in the study area, including the communities of Hood and Courtland.  
12 Implementation of Alternative 1A, depending on final design of the alignment, could require  
13 relocation of the Hood Fire Station and result in environmental effects associated with construction  
14 of a replacement facility. Implementation of Mitigation Measure UT-2 would require the  
15 construction of a replacement facility, if the existing fire station cannot be avoided, and would lessen  
16 the severity of the potential effect by ensuring continuation of fire protection services in the  
17 Courtland Fire Protection District service area. However, because the effects of constructing a new  
18 fire station are unknown, this would be considered an adverse effect. The affected communities of  
19 Hood and Courtland are comprised of a meaningfully greater minority population, as shown on  
20 Figure 28-1, which would be potentially affected by both the disruption of fire protection or  
21 emergency medical services associated with removal of the Hood Fire Station, and the potential  
22 adverse effects of constructing a new fire station. Consequently, this represents a potentially  
23 disproportionate effect on minority populations because the affected community is  
24 disproportionately minority. This is considered an adverse effect.

25 Chapter 20, *Public Services and Utilities*, Section 20.3.3.2, Impact UT-6 describes the potential for  
26 construction of this conveyance alternative to conflict with existing utility facilities in some  
27 locations. Alternative 1A would require relocation of regional power transmission lines and one  
28 natural gas pipeline. Additionally, active gas wells may need to be plugged and abandoned. Further,  
29 construction could disrupt utility services from damage to previously unidentified utilities, or  
30 damage to a utility that could cause a public health hazard (e.g., gas line explosion). Mitigation  
31 Measures UT-6a, UT-6b, and UT-6c would require verifying utility locations prior to construction,  
32 and relocating them to avoid effects on utility operations and worker and public health and safety.  
33 However, because relocation and potential disruption of utility infrastructure would be required  
34 and because it is possible that not all utilities would be identified, and that some service disruption  
35 associated with inadvertent damage would occur, this impact is adverse. Depending on the location  
36 of service loss, minority or low-income populations might be affected. However, because relocation  
37 of an existing known utility would affect the entire service area of that utility this effect would not be  
38 anticipated to result in a disproportionate effect on a minority or low-income population. In  
39 addition, inadvertent damage to or disruption of a previously unknown utility infrastructure would  
40 also not disproportionately affect a minority or low-income populations because it would affect the  
41 general population of the affected service area. This is not considered an adverse effect.

42 Chapter 20, *Public Services and Utilities*, Section 20.3.3.2, Impact UT-8 describes the potential  
43 consequences of implementation of conservation measures on public services at a program-level of  
44 detail. The location and construction or operational details (i.e., water consumption and water  
45 sources associated with conservation measures) for these facilities and programs have not been  
46 developed. Therefore, the need for new or expanded water or wastewater treatment facilities and

1 the potential to disrupt utilities and service in the study area is unknown. Mitigation Measures UT-  
 2 6a, UT-6b, and UT-6c would reduce the impacts on utilities; however, because the effectiveness of  
 3 these measures is unknown, this impact is adverse. Because the effect topic analyzes these effects at  
 4 a general level of detail, it is not amenable to the analysis to determine if it would result in an effect  
 5 on an environmental justice population. Project-level analysis of effects on environmental justice  
 6 populations would be addressed as part of future environmental analysis for implementation of  
 7 conservation measures.

### 8 **28.5.5.6 Air Quality and Greenhouse Gas Emissions**

9 As discussed under Alternative 1A, Chapter 22, *Air Quality and Greenhouse Gases*, Section 22.3.3.2  
 10 addresses the potential effects for a BDCP alternative to generate criteria pollutants that exceed  
 11 local air quality management district thresholds from construction of the proposed water  
 12 conveyance facilities and the implementation of CM2-11. The following adverse effects are relevant  
 13 to this analysis.

#### 14 **Impact AQ-2: Generation of Criteria Pollutants in Excess of the SMAQMD Thresholds during** 15 **Construction of the Proposed Water Conveyance Facility**

#### 16 **Impact AQ-18: Generation of Criteria Pollutants from Implementation of CM2-CM11**

17 As described in Impact AQ-2, construction of Alternative 1A would generate fugitive dust emissions  
 18 exceeding Sacramento Metropolitan Air Quality Management District (SMAQMD) thresholds. The  
 19 impact of generating emissions in excess of local air district thresholds would therefore violate  
 20 applicable air quality standards in the study area and could contribute to or worsen an existing air  
 21 quality conditions. No feasible mitigation is available to reduce fugitive dust emissions; therefore,  
 22 the effect would remain adverse.

23 As described in Impact AQ-18, implementation of CM2-11 under Alternative 1A could generate  
 24 additional traffic on roads and highways in and around Suisun Marsh and the Yolo Bypass related to  
 25 restoration or monitoring activities. These activities require physical changes or heavy-duty  
 26 equipment that would generate construction emissions through earth-moving activities and heavy-  
 27 duty diesel-powered equipment. This would result in an adverse effect if the incremental difference,  
 28 or increase, of criteria pollutants relative to Existing Conditions exceeds applicable local air district  
 29 thresholds. Because the conservation measures are analyzed at a program-level of detail, and have  
 30 not been refined to specific projects with discrete locations, it would be difficult to analyze potential  
 31 disproportionate effects on environmental justice populations. These effects are expected to be  
 32 further evaluated and identified in the subsequent project-level environmental analysis conducted  
 33 for the CM2-CM11 restoration and enhancement actions. However, because of the distribution of  
 34 minority and low-income populations in the study area, there is a potential for such effects.  
 35 Mitigation Measure AQ-18 would be available to reduce this effect.

#### 36 **Mitigation Measure AQ-18: Develop an Air Quality Mitigation Plan (AQMP) to Ensure Air** 37 **District Regulations and Recommended Mitigation are Incorporated into Future** 38 **Conservation Measures and Associated Project Activities**

39 However, it may not be sufficient to reduce emissions below applicable air quality management  
 40 district thresholds. Consequently, this impact would be adverse.

1 Given that the construction and restoration and conservation areas along this alignment are  
 2 proximate to census blocks and block groups where meaningfully greater minority and low-  
 3 income populations occur (Figures 28-1 and 28-2), it is expected that generation of criteria  
 4 pollutants in excess of local air district thresholds would result in a potentially disproportionate  
 5 effect on minority and low-income populations. See Chapter 30, *Growth Inducement and Other*  
 6 *Indirect Effects*, for discussion on any indirect effects on export service areas.

### 7 **28.5.5.7 Noise**

8 Chapter 23, *Noise*, Section 23.4.3.2, identifies the following adverse effects associated with new  
 9 sources of noise and vibration that would be introduced into the study area under Alternative 1A.

#### 10 **Impact NOI-1: Exposure of Noise-Sensitive Land Uses to Noise from Construction of Water** 11 **Conveyance Facilities**

#### 12 **Impact NOI-2: Exposure of Sensitive Receptors to Vibration or Groundborne Noise from** 13 **Construction of Water Conveyance Facilities**

#### 14 **Impact NOI-4: Exposure of Noise-Sensitive Land Uses to Noise from Implementation of** 15 **Proposed Conservation Measures**

16 Chapter 23, *Noise*, Section 23.4.3.2, Impacts NOI-1 and NOI-2, describe vibration and noise effects  
 17 associated with construction of this alternative that would occur at discrete locations along the  
 18 conveyance facility, and would affect adjacent residents or other sensitive receptors. Specifically, as  
 19 described in Chapter 23, *Noise*, Section 23.4.3.2, Impact NOI-1, noise from construction of intakes;  
 20 construction of conveyance, forebays, barge unloading facilities, and intermediate pumping plants;  
 21 truck trips and worker commutes; construction of power transmission lines; and earth-moving at  
 22 offsite borrow/spoil areas is predicted to exceed daytime and nighttime noise standards in areas  
 23 zoned for sensitive land uses including residential, natural/recreational, agricultural residential, and  
 24 schools.

25 Groundborne vibration from impact pile driving, discussed in Chapter 23, *Noise*, Section 23.4.3.2,  
 26 Impact NOI-2, is predicted to exceed vibration thresholds in areas zoned for residential, including  
 27 agricultural residential, land uses in areas listed below.

- 28 ● Sacramento County – including River Road near the community of Hood, neighborhoods in the  
 29 community of Hood.
- 30 ● Yolo County – including County Road E9 near the community of Clarksburg.
- 31 ● San Joaquin County.

32 As shown in Figures 28-1 and 28-2, there are census blocks and block groups with meaningfully  
 33 greater proportions of minority and low-income populations in the vicinity of heavy construction  
 34 work areas (e.g., intake locations, the pipeline/tunnel alignment, and the forebays) where vibration  
 35 and noise effects are predicted to exceed noise standards for nearby residents. Construction of  
 36 intakes and the tunnel would result in groundborne vibration and groundborne noise levels that  
 37 exceed noise thresholds at nearby receptors, including residential structures. The effect of exposing  
 38 sensitive receptors to vibration or groundborne noise would be adverse.

1 Chapter 23, *Noise*, Section 23.4.3.2, Impact NOI-4, describes the noise effects of conservation  
 2 measures. Because the conservation measures are analyzed at a program-level of detail, and have  
 3 not been refined to specific projects with discrete locations, it would be difficult to analyze potential  
 4 disproportionate effects on environmental justice populations. However, because of the distribution  
 5 of minority and low-income populations in the study area, there is a potential for such effects.

6 Chapter 23, *Noise*, Section 23.4.3.2, identifies mitigation measures that would reduce noise and  
 7 vibration effects.

8 **Mitigation Measure NOI-1a: Employ Noise-Reducing Construction Practices during**  
 9 **Construction**

10 **Mitigation Measure NOI-1b: Prior to Construction, Initiate a Complaint/Response**  
 11 **Tracking Program**

12 **Mitigation Measure NOI-2: Employ Vibration-Reducing Construction Practices during**  
 13 **Construction of Water Conveyance Facilities**

14 In addition, the environmental commitment to develop and implement a Noise Abatement Plan  
 15 would reduce these effects (Appendix 3B, *Environmental Commitments*). Although these mitigation  
 16 measures and environmental commitments would be available to reduce these effects, it is not  
 17 anticipated that feasible measures would be available in all situations to reduce construction noise  
 18 to levels below the applicable thresholds. The effect of exposing noise-sensitive land uses to noise  
 19 increases above thresholds is considered adverse. Although mitigation measures are available to  
 20 address this temporary effect, because the noise and vibration effects would occur in areas with  
 21 meaningfully greater minority and low-income populations, this represents a disproportionate  
 22 effect. This effect is considered adverse.

23 **28.5.5.8 Public Health**

24 Chapter 25, *Public Health*, Section 25.3.3.2, identifies the potential for the operation of this  
 25 alternative to increase concentrations of bromide and associated disinfectant byproducts (DPBs) at  
 26 Barker Slough, a source of water for the North Bay Aqueduct:

27 **Impact PH-2: Exceedances of Water Quality Criteria for Constituents of Concern Such That**  
 28 **There Is an Adverse Effect on Public Health as a Result of Operation of the Water Conveyance**  
 29 **Facilities**

30 This would be an adverse effect because these chemicals are associated with adverse health effects.  
 31 In addition, the contribution of this alternative would add to the foreseeable future increase in DPBs  
 32 that would happen in the absence of the project, as described in Chapter 25, *Public Health*, Section  
 33 25.4. Mitigation Measure WQ-5 is available to reduce this effect:

34 **Mitigation Measure WQ-5: Avoid, Minimize, or Offset, as Feasible, Adverse Water Quality**  
 35 **Conditions**

36 While Mitigation Measure WQ-5 may reduce this impact, the feasibility and effectiveness of this  
 37 mitigation measure is uncertain based on currently available information. Therefore, the  
 38 available mitigation would not necessarily reduce the impact to a level that would be adverse.

1 The North Bay Aqueduct serves Napa and Solano Counties. This analysis assumes the decrease  
 2 in water quality for waters conveyed in this aqueduct would affect the entire service population  
 3 using water from the North Bay Aqueduct, which is approximately the same as the demographic  
 4 profile for each county as a whole. Napa County as a whole does not have a meaningfully greater  
 5 minority population (the total minority population is approximately 44%, U.S. Census Bureau  
 6 2012a). Solano County however has a total minority population of approximately 59% (U.S.  
 7 Census Bureau 2012b). Neither county has a meaningfully greater low-income population.  
 8 Because the increase in bromide and DPBs would decrease water quality for Solano County  
 9 service population, this would disproportionately affect minorities. This is an adverse effect.

### 10 **28.5.5.9 Summary of Environmental Justice Effects under Alternative 1A**

11 Alternative 1A would result in disproportionate effects on minority and low-income communities  
 12 resulting from land use, socioeconomic, aesthetics and visual resources, cultural resources, noise,  
 13 and public health effects. Mitigation and environmental commitments are available to reduce these  
 14 effects; however, effects would remain adverse. For these reasons, effects on minority and low-  
 15 income populations would be disproportionate and adverse.

## 16 **28.5.6 Alternative 1B—Dual Conveyance with East Alignment 17 and Intakes 1–5 (15,000 cfs; Operational Scenario A)**

18 This section analyzes the environmental justice effects of the resource topics that are carried  
 19 forward for detailed analysis for Alternative 1B. Relevant environmental justice effects associated  
 20 with adverse effects identified in these chapters are analyzed to determine if they would result in a  
 21 disproportionate effect on minority or low-income populations. Generally, impact mechanisms and  
 22 effects are similar to those described for Alternative 1A. This section focuses on the differences from  
 23 Alternative 1A. While the same impact mechanisms have the potential to disproportionately affect  
 24 minority and low-income populations, these effects would result from the construction of a canal  
 25 through the eastern portion of the study area rather than the central pipeline/tunnel option. Figures  
 26 28-1 and 28-2 show the distribution of minority and low-income populations in relation to the east  
 27 alignment, which includes Alternative 1B.

### 28 **28.5.6.1 Land Use**

29 As described under Alternative 1A, Chapter 13, *Land Use*, Section 13.3.3.3, addresses the potential  
 30 effects for a BDCP alternative to result in the relocation of residents, or a physical effect on existing  
 31 structures, with the consequence that adverse effects on the physical environment would result. The  
 32 following adverse effect is relevant to this analysis.

#### 33 **Impact LU-2: Conflicts with Existing Land Uses as a Result of Constructing the Proposed 34 Water Conveyance Facility (CM1)**

#### 35 **Impact LU-3: Create Physical Structures Adjacent to and through a Portion of an Existing 36 Community as a Result of Constructing the Proposed Water Conveyance Facility (CM1)**

37 Under Alternative 1B, approximately 400 permanent structures would be removed or relocated  
 38 within the water conveyance facility footprint, including approximately 109 residential buildings. As  
 39 with Alternative 1A, the physical footprints of the intake facilities and their associated conveyance  
 40 pipelines are anticipated to create the largest disruption to residential structures.

1 As shown in Figure 28-1, there are census blocks with a meaningfully greater minority population  
 2 (more than 50%) throughout the study area, and specifically along the east alignment. Because the  
 3 construction of Intakes 1–5 would result in the displacement of approximately 109 residences,  
 4 which would affect census blocks where the minority population is over 50%, this would represent  
 5 a disproportionate effect on minority populations. When required, DWR would provide  
 6 compensation to property owners for property losses due to implementation of the alternative,  
 7 which would reduce the severity of economic effects related to this physical effect, but would not  
 8 reduce the severity of the physical effect itself. For these reasons, this effect would be adverse.

9 In addition, Chapter 13, *Land Use*, Section 13.3.3.3, examines the potential to divide existing  
 10 communities. Under Alternative 1B, construction activities associated with Intake 4 and its  
 11 associated facilities, the canal, and a bridge over the canal would separate the community of Hood  
 12 from surrounding areas. Even though access to and from the community would be maintained over  
 13 the long-term, the placement of Intake 4 and the canal, as well as the nearby construction of Intake  
 14 3, would create lasting physical barriers between Hood and the surrounding lands.

15 Additionally, construction and the long-term placement of Intake 3 (about 0.5 mile north of Hood)  
 16 and the canal (running north to south) would create further divisions between Hood and the  
 17 surrounding lands. While a permanent physical division within the community itself is not  
 18 anticipated to result from these features, activities associated with their construction would create  
 19 divisions over a multiyear period. Additionally, the lasting placement of the intake facilities and the  
 20 canal would establish physical barriers between the community and its surroundings, constituting  
 21 an adverse effect. Mitigation Measures TRANS-1a and TRANS-1b are available to address this effect.

22 As shown in Figures 28-1 and 28-2, the community of Hood is composed of both census blocks with  
 23 a meaningfully greater minority population (more than 50%) and block groups with low-income  
 24 populations. Consequently, the division of the community of Hood would have a disproportionately  
 25 adverse effect on minority and low-income populations in Hood, because of the higher proportion of  
 26 minority populations in the vicinity. This would be an adverse effect.

## 27 **28.5.6.2 Socioeconomics**

28 The same impact mechanisms identified for Alternative 1A would result in effects on local  
 29 employment conditions under Alternative 1B (Impacts ECON-1 and ECON-7). The general economic  
 30 effects of reduced export alternatives (6A, 6B, 6C, 7, and 8) on south-of-Delta areas are described in  
 31 Chapter 30, *Growth Inducement and Other Indirect Effects*, Section 30.3.2. The impacts analyzed  
 32 below have the potential to disproportionately affect environmental justice populations. Other  
 33 effects in Chapter 16, *Socioeconomics*, Section 16.3.3.3, are not analyzed in this section because they  
 34 either relate to program-level conservation measures that do not have sufficient project-level detail  
 35 to identify environmental justice consequences, or because they do not have the potential to  
 36 disproportionately affect environmental justice populations.

37 Construction of the proposed water conveyance facilities would increase total employment and  
 38 income in the study area. The change would result from expenditures on construction and from  
 39 changes in agricultural production. Changes in jobs in the study area as a result of construction are  
 40 reported in Chapter 16, Section 16.3.3.3, *Socioeconomics*, Table 16-25. During the peak construction  
 41 year, it is estimated that 6,279 jobs (direct) and 12,985 jobs total (direct, indirect, and induced  
 42 effects) would be gained in the study area.

1 However, construction of conveyance and related facilities, such as roads and utilities, would cause  
 2 temporary and permanent conversion of agricultural land. Because construction would reduce  
 3 agricultural land under cultivation, construction would result in the direct loss of 90 agricultural  
 4 jobs/year and a total loss of 340 agricultural jobs/year (including direct, indirect and induced  
 5 effects) (Chapter 16, *Socioeconomics*, Section 16.3.3.3, Table 16-26).

6 As described for Chapter 16, *Socioeconomics*, Section 16.3.3.3, Impact ECON-7, operation of  
 7 conveyance facilities constructed under Alternative 1B would result in the direct creation of 204  
 8 jobs/year and the creation of 294 jobs total (Chapter 16, *Socioeconomics*, Section 16.3.3.3, Table 16-  
 9 28). However, because operations would reduce agricultural cultivation, operations would result in  
 10 the direct loss of 117 agricultural jobs/year and a total of 321 agricultural jobs/year (including  
 11 direct, indirect and induced effects) (Chapter 16, *Socioeconomics*, Section 16.3.3.3, Table 16-29).

12 Because the majority of farm labor in the study area is minority, including those of Hispanic origin  
 13 and potentially low-income, loss of up to 340 agricultural jobs/year in the study area associated  
 14 with construction of the conveyance facility is considered to be a disproportionate effect on an  
 15 environmental justice population. However, the overall employment effect in the study area related  
 16 to construction and operation of the conveyance facility would be an increase in construction and  
 17 facility operation employment, which may have some unknown positive effect on the environmental  
 18 justice population in the study area. Despite the potential for a beneficial employment effect in the  
 19 study area under Alternative 1B, the disproportionate effect on agricultural workers is considered  
 20 an adverse effect because this effect would disproportionately accrue to a minority population.

### 21 **28.5.6.3 Aesthetics and Visual Resources**

22 Similar impact mechanisms described for Alternative 1A would generate effects on visual resources  
 23 for Alternative 1B. Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.3, identifies the  
 24 following adverse effects.

#### 25 **Impact AES-1: Substantial Alteration in Existing Visual Quality or Character during** 26 **Construction of Conveyance Facilities**

#### 27 **Impact AES-2: Permanent Effects on a Scenic Vista from Presence of Conveyance Facilities**

#### 28 **Impact AES-3: Permanent Damage to Scenic Resources along a State Scenic Highway from** 29 **Construction of Conveyance Facilities**

#### 30 **Impact AES-4: Creation of a New Source of Light or Glare That Would Adversely Affect Views** 31 **in the Area as a Result of Construction and Operation of Conveyance Facilities**

#### 32 **Impact AES-6: Substantial Alteration in Existing Visual Quality or Character during** 33 **Implementation of CM2–CM22**

34 Impact AES-6 analyzes the effect of the implementation of CM2–CM22 on aesthetics and visual  
 35 resources. This effect is adverse. However because the precise location of where future conservation  
 36 measures will be implemented is unknown, this impact is not carried forward for further analysis of  
 37 environmental justice effects for this alternative or other alternatives.

38 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.3, also identifies the following mitigation  
 39 measures that would reduce the identified effects on aesthetics and visual resources.

1 **Mitigation Measure AES-1a: Locate New Transmission Lines and Access Routes to**  
 2 **Minimize the Removal of Trees and Shrubs and Pruning Needed to Accommodate New**  
 3 **Transmission Lines and Underground Transmission Lines Where Feasible**

4 **Mitigation Measure AES-1b: Install Visual Barriers between Construction Work Areas and**  
 5 **Sensitive Receptors**

6 **Mitigation Measure AES-1c: Develop and Implement a Spoil/Borrow and Reusable Tunnel**  
 7 **Material Area Management Plan**

8 **Mitigation Measure AES-1d: Restore Barge Unloading Facility Sites Once Decommissioned**

9 **Mitigation Measure AES-1e: Apply Aesthetic Design Treatments to All Structures to the**  
 10 **Extent Feasible**

11 **Mitigation Measure AES-1f: Locate Concrete Batch Plants and Fuel Stations Away from**  
 12 **Sensitive Visual Resources and Receptors and Restore Sites upon Removal of Facilities**

13 **Mitigation Measure AES-1g: Implement Best Management Practices to Implement Project**  
 14 **Landscaping Plan**

15 **Mitigation Measure AES-4a: Limit Construction to Daylight Hours within 0.25 Mile of**  
 16 **Residents**

17 **Mitigation Measure AES-4b: Minimize Fugitive Light from Portable Sources Used for**  
 18 **Construction**

19 **Mitigation Measure AES-4c: Install Visual Barriers along Access Routes, Where Necessary,**  
 20 **to Prevent Light Spill from Truck Headlights toward Residences**

21 **Mitigation Measure AES-6a: Underground New or Relocated Utility Lines Where Feasible**

22 **Mitigation Measure AES-6b: Develop and Implement an Afterhours Low-intensity and**  
 23 **Lights off Policy**

24 **Mitigation Measure AES-6c: Implement a Comprehensive Visual Resources Management**  
 25 **Plan for the Delta and Study Area**

26 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.3, Impacts AES-1 through AES-4, describe  
 27 the aesthetics and visual resources effects associated with water conveyance facilities construction  
 28 and operations. Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.3, Impact AES-3 describes  
 29 the effects on local scenic highways, such as SR 160. Because degradation of a scenic highway would  
 30 result in loss of scenic qualities for all highway users, it is not carried forward for environmental  
 31 justice analysis.

32 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.3, Impact AES-1 describes the effect of  
 33 construction activities on the visual quality and character of the study area. Construction of Intakes  
 34 1–5 and the accompanying pump stations, surge towers, canals, borrow/spoil areas, RTM areas,  
 35 forebay, access roads, transmission lines, and concrete batch plants and fuel stations would  
 36 introduce visually discordant features into foreground and middleground views with low to high

1 landscape sensitivity level. These elements would introduce visually dominant features that would  
2 be very noticeable to all viewer groups and would segment the visual landscape of the study area,  
3 reduce the amount of open space lands available to viewers, and eliminate valued visual resources.  
4 Accordingly, because of the long-term nature of construction, proximity to sensitive receptors,  
5 razing of residences and agricultural buildings, removal of vegetation, and changes to topography  
6 through grading, this effect is considered adverse. Effects on the existing visual character under  
7 Alternative 1B would be greater than under Alternative 1A because of the extent of the canals visible  
8 on the landscape surface, landscape scars left behind by spoil/borrow areas, and introduction of  
9 bridges. Overall, effects on the existing visual character associated with construction of Alternative  
10 1B would be adverse. Mitigation Measures AES-1a through AES-1g are available to address these  
11 adverse effects.

12 Impact AES-2 describes the permanent alteration of scenic resources resulting from construction.  
13 Intakes 1–5 and landscape scars remaining from spoil/borrow areas, and transmission lines would  
14 be similar to the effects described for Alternative 1A. However, spoil/borrow areas would take up a  
15 much greater area between Intake 1 and Dierssen Road than under Alternative 1A. These changes  
16 would have a much greater effect on available views from SR 160 and near the towns of Clarksburg  
17 and Hood, which have a higher concentration of residential, recreational, and roadway viewers.  
18 Permanent effects on scenic vistas associated with Alternative 1B may be adverse. Effects on scenic  
19 vistas under Alternative 1B would be greater than under Alternative 1A because of the extent of the  
20 canals visible on the landscape surface, landscape scars left behind by spoil/borrow areas, and  
21 introduction of bridges. Mitigation Measures AES-1a, AES-1c, and AES-1e are available to address  
22 these effects.

23 Impact AES-4 describes the potential for new sources of light and glare that would be introduced  
24 during construction or as part of permanent features that would remain after the conveyance  
25 facilities are complete. Intakes 1–5 would generate construction-phase and permanent sources of  
26 light. Evening and nighttime construction activities would require use of extremely bright lights and  
27 generate increased nighttime headlights flashing into nearby residents' homes; these light sources  
28 would affect adjacent populations. The intermediate forebay would not be constructed, but the  
29 presence of canals would introduce a linear feature that would require nighttime lighting at for  
30 safety. Transmission lines would require safety lighting at night so the facility would be visible to  
31 aircraft. Because the study area has low levels of ambient daytime glare and nighttime light, light  
32 and glare effects related to the presence of bridges, canals, and transmission lines during operation  
33 under this alternative and would adversely affect daytime and nighttime views.

34 While mitigation is available to reduce the effects of Impacts AES-1, AES-2, and AES-4, these effects  
35 would remain adverse. As shown in Figures 28-1 and 28-2, meaningfully greater minority and low-  
36 income populations occur throughout the study area, including along the east alignment alternative.  
37 Specifically, a concentration of minority and low-income populations are located in the communities  
38 of Clarksburg, Walnut Grove, Hood, and Courtland, where residential viewers in these communities  
39 would be affected by adverse visual effects of this alternative.

40 Because adverse visual effects are largely associated with the northern portion of the alignment  
41 where permanent features would remain and along the southern portion of the alignment where the  
42 Byron Tract Forebay and borrow and spoil areas would be constructed, where minority and low-  
43 income populations, these effects would disproportionately affect these populations. For these  
44 reasons, although mitigation is available to reduce the severity of these effects, this effect would be

1 adverse because it occur in a geographic location with meaningfully greater minority and low-  
2 income communities.

### 3 **28.5.6.4 Cultural Resources**

4 Construction of conveyance facilities under this alternative would have adverse effects on  
5 prehistoric archaeological resources, unidentified human remains, historic archaeological sites,  
6 traditional cultural properties, and built environment resources, as described in Impacts CUL-1  
7 through Impact CUL-7.

8 **Impact CUL-1: Effects on Identified Archaeological Sites Resulting from Construction of**  
9 **Conveyance Facilities**

10 **Impact CUL-2: Effects on Archaeological Sites to Be Identified through Future Inventory**  
11 **Efforts**

12 **Impact CUL-3: Effects on Archaeological Sites That May Not Be Identified through Inventory**  
13 **Efforts**

14 **Impact CUL-4: Effects on Buried Human Remains Damaged during Construction**

15 **Impact CUL-5: Direct and Indirect Effects on Eligible and Potentially Eligible Historic**  
16 **Architectural/Built-Environment Resources Resulting from Construction Activities**

17 **Impact CUL-6: Direct and Indirect Effects on Unidentified and Unevaluated Historic**  
18 **Architectural/Built-Environment Resources Resulting from Construction Activities**

19 **Impact CUL-7: Effects of Other Conservation Measures on Cultural Resources**

20 Impact CUL-8 addresses the compatibility of the BDCP with the adopted cultural resource  
21 management policies of agencies with land use authority in the Delta. Because this effect is not a  
22 physical environmental effect that could result in impacts on environmental justice populations, it is  
23 not relevant to this analysis. Ground-disturbing construction has the potential to damage both  
24 identified and previously unrecorded examples of each of these resources. Mitigation is available to  
25 reduce these effects.

26 **Mitigation Measure CUL-1: Prepare a Data Recovery Plan and Perform Data Recovery**  
27 **Excavations on the Affected Portion of the Deposits of Identified and Significant**  
28 **Archaeological Sites**

29 **Mitigation Measure CUL-2: Conduct inventory, Evaluation, and Treatment of**  
30 **Archaeological Resources**

31 **Mitigation Measure CUL-3: Implement an Archaeological Cultural Resources Discovery**  
32 **Plan, Perform Training of Construction Workers, and Conduct Construction Monitoring**

33 **Mitigation Measure CUL-4: Follow State and Federal Law Governing Human Remains If**  
34 **Such Resources Are Discovered during Construction**

1           **Mitigation Measure CUL-5: Consult with Relevant Parties, Prepare and Implement a Built**  
 2           **Environment Treatment Plan**

3           **Mitigation Measure CUL-6: Conduct a Survey of inaccessible Properties to Assess**  
 4           **Eligibility, Determine If These Properties Will Be Adversely Impacted by the Project, and**  
 5           **Develop Treatment to Resolve or Mitigate Adverse Impacts**

6           **Mitigation Measure CUL-7: Conduct Cultural Resource Studies and Adopt Cultural**  
 7           **Resource Mitigation Measures for Cultural Resource Impacts Associated with**  
 8           **Implementation of Conservation Measures 2–22**

9           Prehistoric resources, especially sites containing human remains, are of special significance to the  
 10          Native American community. In addition, historic-era resources located in the footprint of this  
 11          alternative may be significant for minority populations. While these impact mechanisms are the  
 12          same as described for Alternative 1A, the resources that contribute to these effects are slightly  
 13          different. The geographic distribution of the affected resources is described in Chapter 18, *Cultural*  
 14          *Resources*, Section 18.3.5.3. The number of resources affected by each alternative is indicated in the  
 15          tables provided in Appendix 18B, *Identified Cultural Resources Potentially Affected by BDCP*  
 16          *Alternatives*.

17          These resources represent a tangible link to the past, and, if they contain human remains, a resting  
 18          place for interred ancestors. While prehistoric resources and buried human remains also contain  
 19          significance for the general public (including low-income populations), the significance to the  
 20          general public is typically limited to the scientific value of the resources. Because these resources  
 21          are especially significant to Native American populations and potentially other minority  
 22          populations, adverse effects identified in Chapter 18, *Cultural Resources*, Section 18.3.5.3, Impacts  
 23          CUL-1 through CUL-7 would result in a disproportionate effect on minorities. The affected  
 24          population cannot be identified with specificity because members of tribes that attach significance  
 25          to the resources in the Delta may reside in relatively remote locations rather than in adjacent census  
 26          blocks or even counties. Nonetheless, this alternative would result in a disproportionate effect on  
 27          Native American populations and potentially other minorities.

28          Identification and treatment of cultural resources would be completed under relevant mitigation  
 29          measures described in Chapter 18, *Cultural Resources*, Section 18.3.5.3, such as Mitigation Measure  
 30          CUL-2 and CUL-7. Construction monitoring and discovery protocols would be performed during  
 31          construction under Mitigation Measure CUL-3. State and federal law governing discoveries of human  
 32          remains would be enforced through Mitigation Measure CUL-4. In addition to the mitigation  
 33          measures developed in this EIR/EIS, federal agencies that have a significant role in implementing  
 34          the BDCP are required to comply with Section 106 of the NHPA (16 USC 470f). Section 106 and the  
 35          Section 106 regulations require that the agencies identify effects on historic properties and consult  
 36          with the public (including relevant minority groups) and Native American tribes during the  
 37          management process. Section 106 thus adds another mechanism for identifying resources, and  
 38          developing mitigation that would reduce or avoid adverse effects. Despite these mitigation  
 39          measures, this alternative is likely to result in adverse effects on prehistoric archaeological  
 40          resources, human remains, historic-era resources, and traditional cultural properties because the  
 41          scale of the project makes avoidance of all eligible resources infeasible. In addition, because there is  
 42          no feasible way to identify buried resources that may occur in deep subterranean sections of the  
 43          tunnel in advance of construction, effects on these resources cannot be accurately identified or  
 44          avoided. The effect on Native American populations and other minority populations would remain

1 disproportionate even after mitigation because mitigation cannot guarantee that all resources  
2 would be avoided, or that effects on affected resources would be reduced. For these reasons this  
3 effect would be adverse, because the effects would disproportionately accrue to minority and low-  
4 income populations.

### 5 **28.5.6.5 Public Services and Utilities**

6 The same impact mechanisms described under Alternative 1A would also result in effects on utility  
7 infrastructure and public service providers such as fire stations and police facilities under  
8 Alternative 1B. Chapter 20, *Public Services and Utilities*, Section 20.3.3.3, identifies three adverse  
9 effects under this alternative.

10 As described in Chapter 20, *Public Services and Utilities*, Section 20.3.3.3, Impact UT-2, construction  
11 of the canal segment and bridge would conflict with the Hood Fire Station, at 1125 Hood-Franklin  
12 Road in Hood. Implementation of Mitigation Measure UT-2 would require the construction of a  
13 replacement facility, if the existing fire station cannot be avoided and would lessen the severity of  
14 the potential effect by ensuring continuation of fire protection services in the Courtland Fire  
15 Protection District service area. While Mitigation Measure UT-2 would ensure that fire protection  
16 services are not interrupted, the potential relocation is considered an adverse effect. The affected  
17 communities of Hood and Courtland are comprised of a meaningfully greater minority population,  
18 as shown on Figure 28-1, which would be potentially affected by both the disruption of fire  
19 protection or emergency medical services associated with removal of the Hood Fire Station, and  
20 potential adverse effects of constructing a new fire station. Consequently, this represents a  
21 potentially disproportionate effect on a minority population, because the effect would occur in a  
22 geographic location with a meaningfully greater minority population. This is considered an adverse  
23 effect.

24 Chapter 20, *Public Services and Utilities*, Section 20.3.3.3, Impact UT-6 describes the potential for  
25 construction of this conveyance alternative to conflict with existing utility facilities in some  
26 locations. Alternative 1B would require relocation of regional power transmission lines and one  
27 natural gas pipeline. Additionally, active gas wells may need to be plugged and abandoned. Further,  
28 construction could disrupt utility services from damage to previously unidentified utilities, or  
29 damage to a utility that could cause a public health hazard (e.g., gas line explosion). Mitigation  
30 Measures UT-6a, UT-6b, and UT-6c would require verifying utility locations prior to construction,  
31 and relocating them to avoid effects on utility operations and worker and public health and safety.  
32 However, because relocation and potential disruption of utility infrastructure would be required  
33 and because it is possible that not all utilities would be identified, and that some service disruption  
34 associated with inadvertent damage would occur, this impact is adverse. Depending on the location  
35 of service loss, minority or low-income populations might be affected. However, because relocation  
36 of an existing known utility would affect the entire service area of that utility, this effect would not  
37 be anticipated to result in a disproportionate effect on a minority or low-income population. In  
38 addition, inadvertent damage to or disruption of a previously unknown utility infrastructure would  
39 also not disproportionately affect a minority or low-income population because it would affect the  
40 general population of the affected service area. This is not considered an adverse effect.

41 Chapter 20, *Public Services and Utilities*, Section 20.3.3.3, Impact UT-8 describes the potential  
42 consequences of conservation measures on public services at a programmatic level of detail. The  
43 location and construction or operational details (i.e., water consumption and water sources  
44 associated with conservation measures) for these facilities and programs have not been developed.

1 Therefore, the need for new or expanded water or wastewater treatment facilities and the potential  
 2 to disrupt utilities and service in the study area is unknown. Mitigation Measures UT-6a, UT-6b, and  
 3 UT-6c would reduce effects on utilities; however, because the effectiveness of these measures is  
 4 unknown, this impact is adverse. Because the effect topic analyzes these effects at a general level of  
 5 detail, it is not amenable to analysis to determine if it would result in an effect on an environmental  
 6 justice population. Project-level analysis of effects on environmental justice populations would be  
 7 addressed as part of future environmental analysis for implementation of conservation measures.

### 8 **28.5.6.6 Air Quality and Greenhouse Gas Emissions**

9 As discussed under Alternative 1B, Chapter 22, *Air Quality and Greenhouse Gases*, Section 22.3.3.3  
 10 addresses the potential effects for a BDCP alternative to generate criteria pollutants that exceed air  
 11 quality district and federal *de minimis* thresholds from construction of the proposed water  
 12 conveyance facilities or the implementation of CM2-11. The following adverse effects are relevant to  
 13 this analysis.

#### 14 **Impact AQ-2: Generation of Criteria Pollutants in Excess of the SMAQMD Thresholds during** 15 **Construction of the Proposed Water Conveyance Facility**

#### 16 **Impact AQ-9: Generation of Criteria Pollutants in the Excess of Federal *De Minimis* Thresholds** 17 **from Construction and Operation and Maintenance of the Proposed Water Conveyance** 18 **Facility**

#### 19 **Impact AQ-18: Generation of Criteria Pollutants from Implementation of CM2-CM11**

20 As described in Impact AQ-2, construction of Alternative 1B would generate fugitive dust emissions  
 21 exceeding SMAQMD thresholds. The impact of generating emissions in excess of local air district  
 22 thresholds would therefore violate applicable air quality standards in the study area and could  
 23 contribute to or worsen an existing air quality conditions. No feasible mitigation is available to  
 24 reduce fugitive dust emissions; therefore, the effect would remain adverse.

25 As described in Impact AQ-9, construction of the water conveyance facilities under this alignment  
 26 would exceed San Joaquin Valley Air Pollution Control District (SJVAPCD) federal *de minimis*  
 27 thresholds for CO. DWR has identified several environmental commitments to reduce construction-  
 28 related criteria pollutants. However, because the current emissions estimates exceed the San  
 29 Joaquin Valley Air Basin (SJVAB) federal *de minimis* threshold for CO, a positive conformity  
 30 determination for CO cannot be satisfied through the purchase of offsets within the SJVAB. This  
 31 impact would remain adverse. In the event that Alternative 1B is selected, Reclamation, USFWS, and  
 32 NMFS would need to demonstrate that conformity is met for CO through a local air quality modeling  
 33 analysis (i.e., dispersion modeling) to ensure project emissions do not cause or contribute to any  
 34 new violation of the CO national ambient air quality standards (NAAQS) or increase the frequency or  
 35 severity of any existing violation of the CO NAAQS.

36 As described in Impact AQ-18, implementation of CM2-11 under Alternative 1B could generate  
 37 additional traffic on roads and highways in and around Suisun Marsh and the Yolo Bypass related to  
 38 restoration or monitoring activities. These activities require physical changes or heavy-duty  
 39 equipment that would generate construction emissions through earth-moving activities and heavy-  
 40 duty diesel-powered equipment. This would result in an adverse effect if the incremental difference,  
 41 or increase, of criteria pollutants relative to Existing Conditions exceeds applicable local air district  
 42 thresholds. Because the conservation measures are analyzed at a program-level of detail, and have

1 not been refined to specific projects with discrete locations, it would be difficult to analyze potential  
 2 disproportionate effects on environmental justice populations. These effects are expected to be  
 3 further evaluated and identified in the subsequent project-level environmental analysis conducted  
 4 for the CM2–CM11 restoration and enhancement actions. However, because of the distribution of  
 5 minority and low-income populations in the study area, there is a potential for such effects.  
 6 Mitigation Measure AQ-18 would be available to reduce this effect.

7 Mitigation Measure AQ-18: Develop an Air Quality Mitigation Plan (AQMP) to Ensure Air District  
 8 Regulations and Recommended Mitigation are Incorporated into Future Conservation Measures and  
 9 Associated Project Activities

10 However, it may not be sufficient to reduce emissions below applicable air quality management  
 11 district thresholds. Consequently, this impact would be adverse.

12 Given that the proposed water conveyance facilities and the restoration and conservation areas  
 13 along this alignment are proximate to census blocks and block groups where meaningfully greater  
 14 minority and low-income populations occur (Figures 28-1 and 28-2), it is expected that generation  
 15 of criteria pollutants in excess of local air district and federal de minimis thresholds would result in  
 16 a potentially disproportionate effect on minority and low-income populations. See Chapter 30,  
 17 Growth Inducement and Other Indirect Effects, for discussion on any indirect impacts on export  
 18 service areas.

#### 19 **28.5.6.7 Noise**

20 The same impact mechanisms described under Alternative 1A would result in adverse noise effects  
 21 under Alternative 1B. Effects under Alternative 1B would differ from Alternative 1A primarily in  
 22 location because an eastern canal would be constructed rather than tunnels. The following adverse  
 23 effects would be associated with new sources of noise and vibration introduced into the study area  
 24 under Alternative 1B.

#### 25 **Impact NOI-1: Exposure of Noise-Sensitive Land Uses to Noise from Construction of Water** 26 **Conveyance Facilities**

#### 27 **Impact NOI-2: Exposure of Sensitive Receptors to Vibration or Groundborne Noise from** 28 **Construction of Water Conveyance Facilities**

#### 29 **Impact NOI-4: Exposure of Noise-Sensitive Land Uses to Noise from Implementation of** 30 **Proposed Conservation Measures**

31 Chapter 23, *Noise*, Section 23.4.3.3, Impacts NOI-1 and NOI-2 describe vibration and noise effects  
 32 associated with the construction of this alternative that would occur at discrete locations along the  
 33 conveyance facility, and would affect adjacent residents or other sensitive receptors. Specifically, as  
 34 described in Chapter 23, *Noise*, Section 23.4.3.3, Impact NOI-1, noise from construction of intakes;  
 35 construction of conveyance, a forebay, barge unloading facilities, and intermediate pumping plants;  
 36 truck trips and worker commutes; construction of power transmission lines; and earth-moving at  
 37 offsite borrow/spoil areas is predicted to exceed daytime and nighttime noise standards in areas  
 38 zoned for sensitive land uses including residential, natural/recreational, agricultural residential, and  
 39 schools. Groundborne vibration from impact pile driving, discussed in Chapter 23, *Noise*, Section  
 40 23.4.3.3, Impact NOI-2, is predicted to exceed vibration thresholds in areas zoned for residential,  
 41 including agricultural residential, land uses in areas listed below.

- 1 • Sacramento County – including River Road near the community of Hood; neighborhoods in the
- 2 community of Hood
- 3 • Yolo County – including County Road E9 near the community of Clarksburg
- 4 • San Joaquin County

5 As shown in Figures 28-1 and 28-2, there are census blocks and block groups with meaningfully  
 6 greater proportions of minority and low-income populations in the vicinity of areas of heavy  
 7 construction work areas (e.g., intake locations, the canal alignment, and the forebays) where  
 8 vibration and noise effects are predicted to exceed noise standards for nearby residents. Overall,  
 9 under Alternative 1B, pile driving activities during construction of the intakes and conveyances  
 10 could result in substantial increases in noise levels affecting nearby communities and residences.  
 11 The effect of exposing noise-sensitive land uses to noise increases above thresholds would be  
 12 adverse.

13 Chapter 23, *Noise*, Section 23.4.3.3, Impact NOI-4 describes the noise effects of conservation  
 14 measures. Because the conservation measures are analyzed at a program-level of detail, and have  
 15 not been refined to specific projects with discrete locations, it would be difficult to analyze potential  
 16 disproportionate effects on environmental justice populations. However, because of the distribution  
 17 of minority and low-income populations in the study area, there is a potential for such effects.

18 Mitigation Measures are available to address these effects. Chapter 23, *Noise*, Section 23.4.3.3,  
 19 identifies mitigation measures that would reduce noise and vibration effects.

20 **Mitigation Measure NOI-1a: Employ Noise-Reducing Construction Practices during**  
 21 **Construction**

22 **Mitigation Measure NOI-1b: Prior to Construction, Initiate a Complaint/Response**  
 23 **Tracking Program**

24 **Mitigation Measure NOI-2: Employ Vibration-Reducing Construction Practices during**  
 25 **Construction of Water Conveyance Facilities**

26 In addition, the environmental commitment to develop and implement a Noise Abatement Plan  
 27 would reduce these effects (Appendix 3B, *Environmental Commitments*). Although these mitigation  
 28 measures and environmental commitment would be available to reduce these effects, it is not  
 29 anticipated that feasible measures would be available in all situations to reduce construction noise  
 30 to levels below the applicable thresholds. The effect of exposing noise-sensitive land uses to noise  
 31 increases above thresholds is considered adverse. Although mitigation measures are available to  
 32 address this temporary effect, because the noise and vibration effects would occur in areas with  
 33 meaningfully greater minority and low-income populations, this represents a disproportionate  
 34 effect. This effect is considered adverse.

35 **28.5.6.8 Public Health**

36 Chapter 25, *Public Health*, Section 25.3.3.3, identifies the potential for the operation of this  
 37 alternative to increase concentrations of bromide and associated DPBs at Barker Slough, a source of  
 38 water for the North Bay Aqueduct:

1       **Impact PH-2: Exceedances of Water Quality Criteria for Constituents of Concern Such That**  
 2       **There Is an Adverse Effect on Public Health as a Result of Operation of the Water Conveyance**  
 3       **Facilities**

4       This would be an adverse effect because these chemicals are associated with adverse health effects.  
 5       Mitigation Measure WQ-5 is available to reduce this effect:

6               **Mitigation Measure WQ-5: Avoid, Minimize, or Offset, as Feasible, Adverse Water Quality**  
 7               **Conditions**

8               In addition, the contribution of this alternative would add to the foreseeable future increase in  
 9               DPBs that would happen in the absence of the project, as described in Chapter 25, *Public Health*,  
 10              Section 25.4. While Mitigation Measure WQ-5 may reduce this effect, the feasibility and  
 11              effectiveness of this mitigation measure is uncertain based on currently available information.  
 12              Therefore, the available mitigation would not necessarily reduce the effect.

13             The North Bay Aqueduct serves Napa and Solano Counties. This analysis assumes the decrease  
 14             in water quality for waters conveyed in this aqueduct would affect the entire service population  
 15             using water from the North Bay Aqueduct, which is approximately the same as the demographic  
 16             profile for each county as a whole. Napa County as a whole does not have a meaningfully greater  
 17             minority population (the total minority population is approximately 44%, U.S. Census Bureau  
 18             2012a). Solano County however has a total minority population of approximately 59% (U.S.  
 19             Census Bureau 2012b). Neither county has a meaningfully greater low-income population.  
 20             Because the increase in bromide and DPBs would decrease water quality for Solano County  
 21             service population, this would disproportionately affect minorities. This is an adverse effect.

22       **28.5.6.9       Summary of Environmental Justice Effects under Alternative 1B**

23             Alternative 1B would result in disproportionate effects on minority and low-income communities  
 24             resulting from land use, socioeconomic, aesthetics and visual resources, cultural, air quality and  
 25             greenhouse gas emissions, noise, and public health effects. Mitigation and environmental  
 26             commitments are available to reduce these effects; however, effects would remain adverse. For  
 27             these reasons effects on minority and low-income populations would be disproportionate and  
 28             adverse.

29       **28.5.7       Alternative 1C—Dual Conveyance with West Alignment**  
 30       **and Intakes W1–W5 (15,000 cfs; Operational Scenario A)**

31             This section analyzes the environmental justice effects of the resource topics that are carried  
 32             forward for detailed analysis for Alternative 1C. Relevant environmental justice effects associated  
 33             with adverse effects identified in these resource chapters are analyzed to determine if they would  
 34             result in a disproportionate effect on minority or low-income populations. Generally, impact  
 35             mechanisms and effects are similar to those described for Alternative 1A. While the same impact  
 36             mechanisms have the potential to disproportionately affect minority and low-income populations,  
 37             these effects would result from the construction of conveyance facilities through the western  
 38             portion of the study area rather than the central pipeline/tunnel alignment. Figures 28-1 and 28-2  
 39             show the distribution of minority and low-income populations in relation to the west alignment,  
 40             which includes Alternative 1C.

### 28.5.7.1 Land Use

As described under Alternative 1A, Chapter 13, *Land Use*, Section 13.3.3.4, addresses the potential effects for a BDCP alternative to result in the relocation of residents, or a physical effect on existing structures, with the consequence that adverse effects on the physical environment would result. The following adverse effects are relevant to this analysis.

#### **Impact LU-2: Conflicts with Existing Land Uses as a Result of Constructing the Proposed Water Conveyance Facility (CM1)**

#### **Impact LU-3: Create Physical Structures Adjacent to and through a Portion of an Existing Community as a Result of Constructing the Proposed Water Conveyance Facility (CM1)**

Under Alternative 1C, approximately 726 permanent structures would be removed or relocated within the water conveyance facilities footprint, including approximately 194 residential buildings. The physical footprints of the intake facilities, their associated conveyance pipelines, and canal segments are anticipated to conflict with the most structures under this alternative.

As shown in the Figure 28-1, there are census blocks with a meaningfully greater minority population (more than 50%) throughout the study area, and specifically along the west alignment. Because the construction of Intakes W1–W5 and the canal segments would result in the displacement of approximately 194 residential buildings, which would affect census blocks where the minority population is greater than 50%, this would represent a disproportionate effect on minority populations. DWR would provide compensation to property owners for the property losses due to implementation of the alternative. Compensation would reduce the severity of economic effects related to this physical effect, but would not reduce the severity of the physical effect itself. For these reasons, this effect would be adverse, because it would disproportionately accrue to minority and low-income populations.

In addition, Chapter 13, *Land Use*, Section 13.3.3.4, examines the potential to divide existing communities. Construction activities associated with Intakes W1 and W2, their associated facilities, and segments of conveyance pipeline would separate the community of Clarksburg from surrounding areas. Even though access to and from the community would be maintained over the long-term, the placement of Intake W2, as well as the nearby construction of Intake W1, would create lasting physical barriers between Clarksburg and the surrounding lands. The long-term placement of Intake W2 (adjacent to the south) and Intake W1 (approximately 1 mile north) would create further divisions between Clarksburg and the surrounding lands. While a permanent physical division within the community itself is not anticipated to result from these features, activities associated with their construction would create divisions over a multiyear period. Additionally, the lasting placement of the intake facilities and the canal would establish physical barriers between the community and its surroundings, constituting an adverse effect. Mitigation Measures TRANS-1a and TRANS-1b are available to address this effect.

As shown in Figures 28-1 and 28-2, the community of Clarksburg is composed of both census blocks with a meaningfully greater minority population (more than 50%) and block groups with low-income populations. Consequently, the division of the community of Clarksburg would have a disproportionately adverse effect on minority and low-income populations in Clarksburg. This would be an adverse effect, because it would disproportionately accrue to minority and low-income populations.

### 28.5.7.2 Socioeconomics

The same impact mechanisms identified for Alternative 1A would result in effects on local employment conditions under Alternative 1C (Impacts ECON-1 and ECON-7). The general economic effects of reduced export alternatives (6A, 6B, 6C, 7, and 8) on south-of-Delta areas are described in Chapter 30, *Growth Inducement and Other Indirect Effects*, Section 30.3.2. These impacts have the potential to disproportionately affect environmental justice populations. Other effects in Chapter 16, *Socioeconomics*, Section 16.3.3.4, are not analyzed in this section because they either relate to program-level conservation measures that do not have sufficient project-level detail to identify environmental justice consequences, or because they do not have the potential to disproportionately affect environmental justice populations.

As described in Chapter 16, *Socioeconomics*, Section 16.3.3.4, Impact ECON-1, construction of the water conveyance facilities would increase total employment and income in the study area. The change would result from expenditures on construction and from changes in agricultural production. Changes in jobs in the study area as a result of construction are reported in Chapter 16, *Socioeconomics*, Section 16.3.3.4, Table 16-31. During the peak construction years, it is estimated that 5,300 jobs (direct) and 11,698 jobs total (direct, indirect, and induced effects) would be gained in the study area, for an unlined canal. For a lined canal, peak employment would be slightly higher, with 5,443 direct jobs during the highest year, and 11,931 total jobs (direct, indirect, and induced effects) during the highest year.

However, construction of conveyance and related facilities, such as roads and utilities, would cause temporary and permanent conversion of agricultural land. Because construction would reduce agricultural land under cultivation, construction would result in the direct loss of 64 agricultural jobs/year and a total loss of 240 agricultural jobs/year (including direct, indirect and induced effects) (Chapter 16, *Socioeconomics*, Section 16.3.3.4, Table 16-32).

As described in Chapter 16, *Socioeconomics*, Section 16.3.3.4, Impact ECON-7, operation of conveyance facilities constructed under Alternative 1C would result in the direct creation of 187 jobs/year and the creation of 269 jobs total (Chapter 16, *Socioeconomics*, Section 16.3.3.4, Table 16-34). However, because operations would reduce agricultural cultivation, operations would result in the direct loss of 75 agricultural jobs/year and a total of 216 agricultural jobs/year (including direct, indirect, and induced effects) (Chapter 16, *Socioeconomics*, Section 16.3.3.4, Table 16-35).

Because the majority of farm labor in the study area is minority, including those of Hispanic origin and potentially low-income, loss of up to 240 agricultural jobs/year in the study area associated with construction of the conveyance facilities is considered to be a disproportionate effect on an environmental justice population. However, the overall employment effect in the study area related to construction and operation of the conveyance facilities would be an increase in construction and facilities operation employment, which may have some unknown positive effect on the environmental justice population in the study area. Despite the potential for a beneficial employment effect in the study area under Alternative 1C, the disproportionate effect on agricultural workers is considered an adverse effect because this effect would be predominately borne by a minority population currently employed by the agriculture industry in the study area.

### 28.5.7.3 Aesthetics and Visual Resources

Similar impact mechanisms described for Alternative 1A would generate effects on visual resources for Alternative 1C. Alternative 1C would result in the construction of a western canal, which would

1 introduce both temporary and permanent features that would adversely alter the visual  
 2 environment. Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.4, identifies the following  
 3 adverse effects.

4 **Impact AES-1: Substantial Alteration in Existing Visual Quality or Character during**  
 5 **Construction of Conveyance Facilities**

6 **Impact AES-2: Permanent Effects on a Scenic Vista from Presence of Conveyance Facilities**

7 **Impact AES-3: Permanent Damage to Scenic Resources along a State Scenic Highway from**  
 8 **Construction of Conveyance Facilities**

9 **Impact AES-4: Creation of a New Source of Light or Glare That Would Adversely Affect Views**  
 10 **in the Area as a Result of Construction and Operation of Conveyance Facilities**

11 **Impact AES-6: Substantial Alteration in Existing Visual Quality or Character during**  
 12 **Implementation of CM2–CM22**

13 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.4, Impact AES-6, analyzes the effect of the  
 14 implementation of CM2–CM22 on aesthetics and visual resources. This effect is adverse. However  
 15 because the precise location of where future conservation measures will be implemented is  
 16 unknown, this impact is not carried forward for further analysis of environmental justice effects for  
 17 this alternative or other alternatives.

18 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.4, also identifies the following mitigation  
 19 measures that would reduce the identified effects on aesthetics and visual resources.

20 **Mitigation Measure AES-1a: Locate New Transmission Lines and Access Routes to**  
 21 **Minimize the Removal of Trees and Shrubs and Pruning Needed to Accommodate New**  
 22 **Transmission Lines and Underground Transmission Lines Where Feasible**

23 **Mitigation Measure AES-1b: Install Visual Barriers between Construction Work Areas and**  
 24 **Sensitive Receptors**

25 **Mitigation Measure AES-1c: Develop and Implement a Spoil/Borrow and Reusable Tunnel**  
 26 **Material Area Management Plan**

27 **Mitigation Measure AES-1d: Restore Barge Unloading Facility Sites Once Decommissioned**

 7           **Lights off Policy**

8           **Mitigation Measure AES-6c: Implement a Comprehensive Visual Resources Management**  
 9           **Plan for the Delta and Study Area**

10          Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.4, Impacts AES-1 through AES-4, describe  
 11          the aesthetics and visual resources effects associated with water conveyance facilities construction  
 12          and operations. Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.4, Impact AES-3,  
 13          describes the effects on local scenic highways, such as SR 160. Because degradation of a scenic  
 14          highway would result in loss of scenic qualities for all highway users, it is not carried forward for  
 15          environmental justice analysis.

16          Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.4, Impact AES-1, describes the effect of  
 17          construction activities on the visual quality and character of the study area. The construction of  
 18          Intakes W1–W5 and accompanying pump stations, surge towers, canals, borrow/spoil areas, RTM  
 19          areas, forebay, access roads, transmission lines, and concrete batch plants and fuel stations would  
 20          introduce visually discordant features in the foreground and middleground views of scenic vistas  
 21          and from scenic roadways, and these elements would be visible to all viewer groups. The existing  
 22          visual character would be greatly altered by the presence of a large-scale intakes and concrete-lined  
 23          and water-filled channels traversing the landscape. In addition, construction of all these features has  
 24          the potential to adversely affect wildlife viewing and the overall enjoyment, segment the visual  
 25          landscape of the study area, reduce the amount of open space lands available to viewers, and  
 26          eliminate valued visual resources within scenic views in the study area. Because of the long-term  
 27          nature of construction, proximity to sensitive receptors, razing of residences and agricultural  
 28          buildings, removal of vegetation, and changes to topography through grading, this effect is  
 29          considered adverse. Effects on the existing visual character under Alternative 1C would be greater  
 30          than those under Alternatives 1A and 1B because of the extent of the canals visible on the landscape  
 31          surface, landscape scars left behind by spoil/borrow areas, introduction of bridges, and closer  
 32          proximity to a greater number of sensitive viewers. Mitigation Measures AES-1a through AES-1g are  
 33          available to reduce these effects.

34          Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.4, Impact AES-2 describes the permanent  
 35          alteration of scenic resources resulting from construction. Intakes W1–W5, landscape scars  
 36          remaining from spoil/borrow areas, and transmission lines would have effects similar to those  
 37          described for Alternative 1A but would be located west of the Sacramento River. Bridges would be  
 38          constructed to cross the canal segments of Alternative 1C, which would create opportunities for  
 39          vista views, but would also introduce elevated structures and raised visual masses that would  
 40          disrupt the continuity of vista views by preventing free-flowing access from lands on either side of  
 41          the bridges. The community of Clarksburg would be surrounded by the canal and Intake W2.  
 42          Overall, permanent effects on scenic vistas associated with the presence of Alternative 1C facilities

1 may be adverse. Effects on scenic vistas under Alternative 1C would be greater than those under  
 2 Alternatives 1A and 1B because of the extent of the canals visible on the landscape, landscape scars  
 3 left behind by spoil/borrow areas, introduction of bridges, and closer proximity to a greater number  
 4 of sensitive viewers. Mitigation Measures AES-1a, AES-1c, and AES-1e are available to address these  
 5 effects.

6 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.4, Impact AES-4, describes the potential  
 7 for new sources of light and glare that would be introduced during construction or as part of  
 8 permanent features that would remain after the conveyance facilities are complete. Intakes W1–W5  
 9 would generate construction-phase and permanent sources of light. Evening and nighttime  
 10 construction activities would require use of extremely bright lights and generate increased  
 11 nighttime headlights flashing into nearby residents' homes; these light sources would affect adjacent  
 12 populations. Light and glare effects related to operation of Intakes W1–W5, canals, spoils/borrow  
 13 areas, RTM areas, shaft sites, Byron Tract Forebay, permanent access roads, and transmission lines  
 14 would introduce the same light and glare effects across the same landscape types as Alternative 1B  
 15 and would have the same or very similar effects on visual resources and viewer groups. The  
 16 presence of canals and the Byron Tract Forebay would require nighttime lighting for safety, and  
 17 introduce glare over a large area. Transmission lines would require safety lighting at night so the  
 18 facility would be visible to aircraft. Because the study area has low levels of ambient daytime glare  
 19 and nighttime light, light and glare effects related to the presence of bridges, canals, and  
 20 transmission lines during operation under this alternative and would adversely affect daytime and  
 21 nighttime views.

22 While mitigation is available to reduce the effects of Impacts AES-1, AES-2, and AES-4, these effects  
 23 would remain adverse. As shown in Figures 28-1 and 28-2, meaningfully greater minority and low-  
 24 income populations occur throughout the study area, including along the west alignment alternative.  
 25 Specifically, a concentration of minority and low-income populations are located in the communities  
 26 of Clarksburg, Hood, and Courtland, where residential viewers would be affected by adverse visual  
 27 effects of this alternative.

28 Because adverse visual effects are largely associated with the northern portion of the alignment  
 29 where permanent features would remain and along the southern portion of the alignment where the  
 30 Byron Tract Forebay and borrow and spoil areas would be constructed, where minority and low-  
 31 income populations occur, these effects would disproportionately affect these populations. For these  
 32 reasons, although mitigation is available to reduce the severity of these effects, these effects would  
 33 be adverse, because they would disproportionately accrue to minority and low-income populations.

#### 34 **28.5.7.4 Cultural Resources**

35 Construction of conveyance facilities under this alternative would have adverse effects on  
 36 prehistoric archaeological resources, unidentified human remains, historic archaeological sites,  
 37 traditional cultural properties, and built environment resources, as described in Chapter 18, *Cultural*  
 38 *Resources*, Section 18.3.5.4, Impacts CUL-1 through CUL-7.

#### 39 **Impact CUL-1: Effects on Identified Archaeological Sites Resulting from Construction of** 40 **Conveyance Facilities**

#### 41 **Impact CUL-2: Effects on Archaeological Sites to Be Identified through Future Inventory** 42 **Efforts**

1 **Impact CUL-3: Effects on Archaeological Sites That May Not Be Identified through Inventory**  
2 **Efforts**

3 **Impact CUL-4: Effects on Buried Human Remains Damaged during Construction**

4 **Impact CUL-5: Direct and Indirect Effects on Eligible and Potentially Eligible Historic**  
5 **Architectural/Built-Environment Resources Resulting from Construction Activities**

6 **Impact CUL-6: Direct and Indirect Effects on Unidentified and Unevaluated Historic**  
7 **Architectural/Built-Environment Resources Resulting from Construction Activities**

8 **Impact CUL-7: Effects of Other Conservation Measures on Cultural Resources**

9 Chapter 18, *Cultural Resources*, Section 18.3.5.4, Impacts CUL-1 through CUL-3, describe potential  
10 effects on archaeological resources that are known and likely to occur in the study area. Because of  
11 the scale of the project and because there is no feasible means of ensuring identification of all  
12 resources in advance of construction, effects on archaeological resources are adverse. In addition,  
13 the project has the potential to inadvertently unearth and damage buried human remains before  
14 they can be protected; effects on buried human remains are therefore adverse. Chapter 18, *Cultural*  
15 *Resources*, Section 18.3.5.4, Impacts CUL-5 and CUL-6, described effects on built environment  
16 resources. Because many significant built environment resources occur in the footprint and  
17 relocation of new facilities is not always feasible, effects on these resources are adverse. Chapter 18,  
18 *Cultural Resources*, Section 18.3.5.4, Impact CUL-7, describes the effects of conservation measures,  
19 which are generally similar to effects that would occur at the project level. Chapter 18, *Cultural*  
20 *Resources*, Section 18.3.5.4, Impact CUL-8, addresses the compatibility of the BDCP with the adopted  
21 cultural resource management policies of agencies with land use authority in the Delta. Because this  
22 effect is not a physical environmental effect that could result in impacts on environmental justice  
23 populations, it is not relevant to this analysis.

24 Ground-disturbing construction has the potential to damage both identified and previously  
25 unrecorded examples of each of these resources. Mitigation is available to reduce these effects.

26 **Mitigation Measure CUL-1: Prepare a Data Recovery Plan and Perform Data Recovery**  
27 **Excavations on the Affected Portion of the Deposits of Identified and Significant**  
28 **Archaeological Sites**

29 **Mitigation Measure CUL-2: Conduct inventory, Evaluation, and Treatment of**  
30 **Archaeological Resources**

31 **Mitigation Measure CUL-3: Implement an Archaeological Cultural Resources Discovery**  
32 **Plan, Perform Training of Construction Workers, and Conduct Construction Monitoring**

33 **Mitigation Measure CUL-4: Follow State and Federal Law Governing Human Remains If**  
34 **Such Resources Are Discovered during Construction**

35 **Mitigation Measure CUL-5: Consult with Relevant Parties, Prepare and Implement a Built**  
36 **Environment Treatment Plan**

1       **Mitigation Measure CUL-6: Conduct a Survey of inaccessible Properties to Assess**  
 2       **Eligibility, Determine If These Properties Will Be Adversely Impacted by the Project, and**  
 3       **Develop Treatment to Resolve or Mitigate Adverse Impacts**

4       **Mitigation Measure CUL-7: Conduct Cultural Resource Studies and Adopt Cultural**  
 5       **Resource Mitigation Measures for Cultural Resource Impacts Associated with**  
 6       **Implementation of Conservation Measures 2–22**

7       Prehistoric resources, especially sites containing human remains, are of special significance to  
 8       the Native American community. The geographic distribution of the affected resources is  
 9       described in Chapter 18, *Cultural Resources*, Section 18.3.5.4. The number of resources affected  
 10      by each alternative is indicated in the tables provided in Appendix 18B, *Identified Cultural*  
 11      *Resources Potentially Affected by BDCP Alternatives*. While these impact mechanisms are the  
 12      same as described for Alternative 1A, the resources that contribute to these effects are different.  
 13      These resources occur in the footprint of the canal, intakes, and other features that would  
 14      require ground-disturbing construction.

15      Identification and treatment of cultural resources would be completed under relevant  
 16      mitigation measures described in Chapter 18, *Cultural Resources*, Section 18.3.5.4, such as  
 17      Mitigation Measures CUL-2 and CUL-7. Construction monitoring and discovery protocols would  
 18      be performed during construction under Mitigation Measure CUL-3. State and federal law  
 19      governing discoveries of human remains would be enforced through Mitigation Measure CUL-4.  
 20      Mitigation Measures CUL-5 and CUL-6 provide for management of effects on built environment  
 21      resources. Mitigation Measure CUL-7 provides for management of effects associated with  
 22      conservation measures. Implementation of the mitigation measures and Section 106  
 23      consultation (see discussion under Alternative 1A, *Cultural Resources*) do not guarantee these  
 24      effects could be reduced or avoided. The effect on Native American populations and other  
 25      minority populations would remain disproportionate even after mitigation because mitigation  
 26      cannot guarantee that all resources would be avoided, or that effects on affected resources  
 27      would be reduced. For these reasons this effect would be adverse, because it would  
 28      disproportionately accrue to minority and low-income populations.

29      **28.5.7.5      Public Services and Utilities**

30      Two of the same impact mechanisms described under Alternative 1A would also result in effects on  
 31      utility infrastructure under Alternative 1C. Chapter 20, *Public Services and Utilities*, Section 20.3.3.4,  
 32      identifies two adverse effects under this alternative.

33      Chapter 20, *Public Services and Utilities*, Section 20.3.3.4, Impact UT-6, describes the potential for  
 34      construction of this conveyance alternative to conflict with existing utility facilities in some  
 35      locations. Alternative 1C would require relocation of regional power transmission lines and one  
 36      natural gas pipeline. Additionally, active gas wells may need to be plugged and abandoned. Further,  
 37      construction could disrupt utility services from damage to previously unidentified utilities, or  
 38      damage to a utility that could cause a public health hazard (e.g., gas line explosion). Mitigation  
 39      Measures UT-6a, UT-6b, and UT-6c would require verifying utility locations prior to construction,  
 40      and relocating them to avoid effects on utility operations and worker and public health and safety.  
 41      However, because relocation and potential disruption of utility infrastructure would be required  
 42      and because it is possible that not all utilities would be identified, and that some service disruption  
 43      associated with inadvertent damage would occur, this impact is adverse. Depending on the location

1 of service loss, minority or low-income populations might be affected. However, because relocation  
 2 of an existing known utility would affect the entire service area of that utility this effect would not be  
 3 anticipated to result in a disproportionate effect on a minority or low-income population. In  
 4 addition, inadvertent damage to or disruption of a previously unknown utility infrastructure would  
 5 also not disproportionately affect a minority or low-income populations because it would affect the  
 6 general population of the affected service area. This is not considered an adverse effect.

7 Chapter 20, *Public Services and Utilities*, Section 20.3.3.4, Impact UT-8, describes the potential  
 8 consequences of conservation measures on public services at a program-level of detail. The location  
 9 and construction or operational details (i.e., water consumption and water sources associated with  
 10 conservation measures) for these facilities and programs have not been developed. Therefore, the  
 11 need for new or expanded water or wastewater treatment facilities and the potential to disrupt  
 12 utilities and service in the study area is unknown. Mitigation Measures UT-6a, UT-6b, and UT-6c  
 13 would reduce the effects on utilities; however, because the effectiveness of these measures is  
 14 unknown, this impact is adverse. Because the effect topic analyzes these effects at a general level of  
 15 detail, it is not amenable to analysis to determine if it would result in an effect on an environmental  
 16 justice population. Project-level analysis of effects on environmental justice populations would be  
 17 addressed as part of future environmental analysis for implementation of conservation measures.

## 18 **28.5.7.6 Air Quality and Greenhouse Gas Emissions**

19 As discussed under Alternative 1C, Chapter 22, *Air Quality and Greenhouse Gases*, Section 22.3.3.4  
 20 addresses the potential effects for a BDCP alternative to generate criteria pollutants that exceed  
 21 local air district and federal *de minimis* thresholds and criteria pollutants from construction of the  
 22 proposed water conveyance facilities and the implementation of CM2-11. The following adverse  
 23 effects are relevant to this analysis.

### 24 **Impact AQ-2: Generation of Criteria Pollutants in Excess of the SMAQMD Thresholds during** 25 **Construction of the Proposed Water Conveyance Facility**

### 26 **Impact AQ-9: Generation of Criteria Pollutants in the Excess of Federal *De Minimis* Thresholds** 27 **from Construction and Operation and Maintenance of the Proposed Water Conveyance** 28 **Facility**

### 29 **Impact AQ-18: Generation of Criteria Pollutants from Implementation of CM2-CM11**

30 As described in Impact AQ-2, construction of Alternative 1C would generate fugitive dust emissions  
 31 exceeding SMAQMD thresholds. The impact of generating emissions in excess of local air district  
 32 thresholds would therefore violate applicable air quality standards in the study area and could  
 33 contribute to or worsen an existing air quality conditions. No feasible mitigation is available to  
 34 reduce fugitive dust emissions; therefore, the impact would remain adverse.

35 As described in Impact AQ-9, construction of the water conveyance facilities under this alignment  
 36 would exceed Sacramento Federal Nonattainment Area (SFNA) and San Francisco Bay Area Air  
 37 Basin (SFBAAB) federal *de minimis* thresholds for CO. DWR has identified several environmental  
 38 commitments to reduce construction-related criteria pollutants. However, because the current  
 39 emissions estimates exceed the SFNA federal *de minimis* threshold for CO, a positive conformity  
 40 determination for CO cannot be satisfied through the purchase of offsets within the SFNA and  
 41 SFBAAB. This impact would remain adverse. In the event that Alternative 1C is selected,

1 Reclamation, USFWS, and NMFS would need to demonstrate that conformity is met for CO through a  
 2 local air quality modeling analysis (i.e., dispersion modeling) or other acceptable methods to ensure  
 3 project emissions do not cause or contribute to any new violations of the NAAQS or increase the  
 4 frequency or severity of any existing violations.

5 As described in Impact AQ-18, implementation of CM2-11 under Alternative 1C could generate  
 6 additional traffic on roads and highways in and around Suisun Marsh and the Yolo Bypass related to  
 7 restoration or monitoring activities. These activities require physical changes or heavy-duty  
 8 equipment that would generate construction emissions through earth-moving activities and heavy-  
 9 duty diesel-powered equipment. This would result in an adverse effect if the incremental difference,  
 10 or increase, of criteria pollutants relative to Existing Conditions exceeds applicable local air district  
 11 thresholds. Because the conservation measures are analyzed at a program-level of detail, and have  
 12 not been refined to specific projects with discrete locations, it would be difficult to analyze potential  
 13 disproportionate effects on environmental justice populations. These effects are expected to be  
 14 further evaluated and identified in the subsequent project-level environmental analysis conducted  
 15 for the CM2–CM11 restoration and enhancement actions. However, because of the distribution of  
 16 minority and low-income populations in the study area, there is a potential for such effects.  
 17 Mitigation Measure AQ-18 would be available to reduce this effect.

18 **Mitigation Measure AQ-18: Develop an Air Quality Mitigation Plan (AQMP) to Ensure Air**  
 19 **District Regulations and Recommended Mitigation are Incorporated into Future**  
 20 **Conservation Measures and Associated Project Activities**

21 However, it may not be sufficient to reduce emissions below applicable air quality management  
 22 district thresholds. Consequently, this effect would be adverse.

23 Given that the proposed water conveyance facilities and the restoration and conservation areas  
 24 along this alignment are proximate to census blocks and block groups where meaningfully  
 25 greater minority and low-income populations occur (Figures 28-1 and 28-2), it is expected that  
 26 generation of criteria pollutants in excess of local air district and federal *de minimis* thresholds  
 27 would result in a potentially disproportionate effect on minority and low-income populations.  
 28 See Chapter 30, *Growth Inducement and Other Indirect Effects*, for discussion on any indirect  
 29 impacts on export service areas.

30 **28.5.7.7 Noise**

31 The same impact mechanisms described under Alternative 1A would result in adverse noise effects  
 32 under Alternative 1C. These effects would differ primarily in location because a western canal would  
 33 be constructed rather than a pipeline and tunnel. The following adverse effects would be associated  
 34 with new sources of noise and vibration introduced into the study area under Alternative 1C.

35 **Impact NOI-1: Exposure of Noise-Sensitive Land Uses to Noise from Construction of Water**  
 36 **Conveyance Facilities**

37 **Impact NOI-2: Exposure of Sensitive Receptors to Vibration or Groundborne Noise from**  
 38 **Construction of Water Conveyance Facilities**

39 **Impact NOI-4: Exposure of Noise-Sensitive Land Uses to Noise from Implementation of**  
 40 **Proposed Conservation Measures**

Chapter 23, *Noise*, Section 23.4.3.4, Impacts NOI-1 and NOI-2 describe vibration and noise effects associated with the construction of this alternative that would occur at discrete locations along the conveyance facility, and would affect adjacent residents or other sensitive receptors. Specifically, as described in Chapter 23, *Noise*, Section 23.4.3.4, Impact NOI-1, noise from construction of intakes; construction of conveyance, forebays, barge unloading facilities, and intermediate pumping plants; truck trips and worker commutes; construction of power transmission lines; and earth-moving at offsite borrow/spoil areas is predicted to exceed daytime and nighttime noise standards in areas zoned for sensitive land uses including residential, natural/recreational, agricultural residential, and schools.

Groundborne vibration from pile driving, discussed in Chapter 23, *Noise*, Section 23.4.3.4, Impact NOI-2, is predicted to exceed vibration thresholds in areas zoned for residential, including agricultural residential, land uses in the areas listed below.

- Sacramento County – including River Road near the community of Hood; Neighborhoods in the community of Hood.
- Yolo County – including County Road E9 near the community of Clarksburg.
- Solano County.

As shown in Figures 28-1 and 28-2, there are census blocks and block groups with meaningfully greater proportions of minority and low-income populations in the vicinity of areas of heavy construction work areas (e.g., intake locations, the canal alignment, and the forebays) where vibration and noise effects are predicted to exceed noise standards for nearby residents. Overall, under Alternative 1C, pile driving activities during construction of the intakes and conveyances could result in substantial increases in noise levels affecting nearby communities and residences. The effect of exposing noise-sensitive land uses to noise increases above thresholds would be adverse.

Chapter 23, *Noise*, Section 23.4.3.4, Impact NOI-4, describes the noise effects of conservation measures. Because the conservation measures are analyzed at a program-level of detail, and have not been refined to specific projects with discrete locations, it would be difficult to analyze potential disproportionate effects on environmental justice populations. However, because of the distribution of minority and low-income populations in the study area, there is a potential for such effects.

Mitigation Measures are available to address these effects. Chapter 23, *Noise*, Section 23.4.3.4, identifies mitigation measures that would reduce noise and vibration effects.

**Mitigation Measure NOI-1a: Employ Noise-Reducing Construction Practices during Construction**

**Mitigation Measure NOI-1b: Prior to Construction, Initiate a Complaint/Response Tracking Program**

**Mitigation Measure NOI-2: Employ Vibration-Reducing Construction Practices during Construction of Water Conveyance Facilities**

In addition, the environmental commitment to develop and implement a Noise Abatement Plan would reduce these effects (Appendix 3B, *Environmental Commitments*). Although these mitigation measures and environmental commitment would be available to reduce these effects, it is not anticipated that feasible measures would be available in all situations to reduce construction noise

1 to levels below the applicable thresholds. The effect of exposing noise-sensitive land uses to noise  
 2 increases above thresholds is considered adverse. Although mitigation measures are available to  
 3 address this temporary effect, because the noise and vibration effects would occur in areas with  
 4 meaningfully greater minority and low-income populations, this represents a disproportionate  
 5 effect. This effect is considered adverse, because it would disproportionately accrue to minority and  
 6 low-income populations.

### 7 **28.5.7.8 Public Health**

8 Chapter 25, *Public Health*, Section 25.3.3.4, identifies the potential for the operation of this  
 9 alternative to increase concentrations of bromide and associated DPBs at Barker Slough, a source of  
 10 water for the North Bay Aqueduct:

#### 11 **Impact PH-2: Exceedances of Water Quality Criteria for Constituents of Concern Such That** 12 **There Is an Adverse Effect on Public Health as a Result of Operation of the Water Conveyance** 13 **Facilities**

14 This would be an adverse effect because these chemicals are associated with adverse health effects.  
 15 Mitigation Measure WQ-5 is available to reduce this effect:

#### 16 **Mitigation Measure WQ-5: Avoid, Minimize, or Offset, as Feasible, Adverse Water Quality** 17 **Conditions**

18 In addition, the contribution of this alternative would add to the foreseeable future increase in  
 19 DPBs that would happen in the absence of the project, as described in Chapter 25, *Public Health*,  
 20 Section 25.4. While Mitigation Measure WQ-5 may reduce this impact, the feasibility and  
 21 effectiveness of this mitigation measure is uncertain based on currently available information.  
 22 Therefore, the available mitigation would not necessarily reduce the effect.

23 The North Bay Aqueduct serves Napa and Solano Counties. This analysis assumes the decrease  
 24 in water quality for waters conveyed in this aqueduct would affect the entire service population  
 25 using water from the North Bay Aqueduct, which is approximately the same as the demographic  
 26 profile for each county as a whole. Napa County as a whole does not have a meaningfully greater  
 27 minority population (the total minority population is approximately 44%, U.S. Census Bureau  
 28 2012a). Solano County however has a total minority population of approximately 59% (U.S.  
 29 Census Bureau 2012b). Neither county has a meaningfully greater low-income population.  
 30 Because the increase in bromide and DPBs would decrease water quality for Solano County  
 31 service population, this would disproportionately affect minorities. This is an adverse effect.

### 32 **28.5.7.9 Summary of Environmental Justice Effects Under Alternative 1C**

33 Alternative 1C would result in disproportionate effects on minority and low-income communities  
 34 resulting from land use, socioeconomics, aesthetics and visual resources, cultural, noise, and public  
 35 health effects. Mitigation and environmental commitments are available to reduce these effects;  
 36 however, effects would remain adverse. For these reasons effects on minority and low-income  
 37 populations would be disproportionate and adverse.

## 28.5.8 Alternative 4—Dual Conveyance With Modified Pipeline/Tunnel And Intakes 2, 3, And 5 (9,000 Cfs; Operational Scenario H)

This section analyzes the environmental justice effects of the resource topics that are carried forward for detailed analysis for Alternative 4. Relevant environmental justice effects associated with adverse effects identified in these resource chapters are analyzed to determine if they would result in a disproportionate effect on minority or low-income populations. Figures 28-1 and 28-2 show the distribution of minority and low-income populations in relation to this alternative.

### 28.5.8.1 Land Use

Chapter 13, *Land Use*, Section 13.3.3.9, identifies effects caused by incompatibility with land use policies, incompatibility with local land uses, and potential for physical division of established communities. By itself, incompatibility with land use policies is not a physical effect on the environment, and, therefore, does not have the potential to result in a disproportionate effect on a minority or low-income population. Chapter 13, *Land Use*, Section 13.3.3.9, also addresses the potential for a BDCP alternative to result in the relocation of residents, or a physical effect on existing structures, with the consequence that adverse effects on the physical environment would result. The following adverse effects are relevant to this analysis.

#### **Impact LU-2: Conflicts with Existing Land Uses as a Result of Constructing the Proposed Water Conveyance Facility (CM1)**

#### **Impact LU-3: Create Physical Structures Adjacent to and through a Portion of an Existing Community as a Result of Constructing the Proposed Water Conveyance Facility (CM1)**

Under Alternative 4, approximately 81 permanent structures would be removed or relocated within the water conveyance facilities footprint, including an estimated 19 residential buildings. The analysis of physical effects on structures in Chapter 13, *Land Use*, Section 13.3.3.9, indicates that the physical footprints of the intake facilities and their associated conveyance pipelines would be anticipated to create the largest disruption to structures. Chapter 13, *Land Use*, Section 13.3.3.2, Table 13-4 summarizes the estimated number of structures affected across structure type and alternative, and Mapbook Figure M13-4 shows the distribution of these effects across the modified pipeline/tunnel conveyance alignment.

As shown in Figures 28-1 and 28-2, there are census blocks with a meaningfully greater minority population (more than 50%) and block groups with low-income populations throughout the study area, and specifically along the modified pipeline/tunnel alignment. Because construction of Intakes 2, 3, and 5 would result in the displacement of approximately 19 residential structures, which would affect census blocks where the minority population is greater than 50%, this would represent a disproportionate effect on minority populations. When required, DWR would provide compensation to property owners for property losses due to implementation of the alternative. Compensation would reduce the severity of economic effects related to this physical effect but would not reduce the severity of the physical effect itself. For these reasons, this would be an adverse effect.

In addition, Chapter 13, *Land Use*, Section 13.3.3.9, examines the potential to divide existing communities. During the construction of the conveyance pipelines and tunnel between Intake 3 and 5 and the intermediate forebay (about 0.5 mile north and south of Hood, respectively for the intakes,

1 and about 5 miles south of Hood for the forebay), construction activities would occur to the north  
 2 and south of the community of Hood. A permanent power line would also be constructed through  
 3 the eastern section of the community. Even though access to and from the community would be  
 4 maintained over the long-term, the nearby construction of a temporary work area adjacent to Hood  
 5 on the southern side of the community would substantially alter the setting of the community in the  
 6 near term. Similarly, the nearby construction of Intakes 3 and 5, although not adjacent to Hood,  
 7 would create permanent physical structures approximately one-quarter mile north and one-half  
 8 mile south of Hood that would substantially alter the community's surroundings. While permanent  
 9 physical structures adjacent to or through Hood are not anticipated to result from this alternative,  
 10 activities associated with their construction could make it difficult to travel within and around Hood  
 11 in certain areas for a limited period of time. Mitigation Measures TRANS-1a and TRANS-1b, which  
 12 would require the development and implementation of a site-specific traffic management plan, and  
 13 establishment of alternative access routes, are available to address this effect. However, permanent  
 14 structures in the community's vicinity constitute an adverse effect.

## 15 **28.5.8.2 Socioeconomics**

16 As shown in Figures 28-1 and 28-2, the community of Hood is composed of both census blocks with  
 17 a meaningfully greater minority population (more than 50%) and block groups with low-income  
 18 populations. Chapter 16, Socioeconomics, Section 13.3.3.9, identified effects on agricultural  
 19 economics and local employment conditions associated with construction, operations, and  
 20 conservation measures. These impacts have the potential to disproportionately affect environmental  
 21 justice populations. Other effects in Chapter 16, Socioeconomics, Section 13.3.3.9, are not analyzed  
 22 in this section because they either relate to program-level conservation measures that do not have  
 23 sufficient project-level detail to identify environmental justice consequences, or because they do not  
 24 have the potential to disproportionately affect environmental justice populations. The following  
 25 effects are analyzed in this section:

### 26 **Impact ECON-1: Temporary Effects on Regional Economics in the Delta Region during** 27 **Construction of the Proposed Water Conveyance Facilities**

### 28 **Impact ECON-7: Permanent Regional Economic Effects in the Delta Region during Operation** 29 **and Maintenance of the Proposed Water Conveyance Facilities**

30 The general economic effects of reduced export alternatives (6A, 6B, 6C, 7, and 8) on south-of-Delta  
 31 areas are described in Chapter 30, *Growth Inducement and Other Indirect Effects*, Section 30.3.2. As  
 32 described in Chapter 16, *Socioeconomics*, Section 13.3.3.9, Impact ECON-1, construction of the water  
 33 conveyance facilities would increase total employment and income in the study area. The change  
 34 would result from expenditures on construction and from changes in agricultural production.  
 35 Changes in jobs in the study area as a result of Alternative 4 construction are reported in Chapter 16,  
 36 *Socioeconomics*, Section 13.3.3.9, Table 16-41. During the peak construction years, it is estimated  
 37 that 3,937 jobs (direct) and 16,029 jobs total (direct, indirect, and induced effects) would be gained  
 38 in the study area.

39 However construction of conveyance and related facilities, such as roads and utilities, would cause  
 40 temporary and permanent conversion of agricultural land. Because construction would reduce  
 41 agricultural land under cultivation, construction would result in the direct loss of 16 agricultural  
 42 jobs/year and a total loss of 57 agricultural jobs/year (direct, indirect, and induced effects) (Chapter  
 43 16, *Socioeconomics*, Section 13.3.3.9, Table 16-42).

1 As described in Chapter 16, *Socioeconomics*, Section 13.3.3.9, Impact ECON-7, operation of  
 2 conveyance facilities constructed under Alternative 4 would result in the direct creation of 129  
 3 jobs/year and the creation of 183 jobs total (Chapter 16, *Socioeconomics*, Section 13.3.3.9, Table 16-  
 4 44, the same effect as Alternative 1A). However, because operations would reduce agricultural  
 5 cultivation, operations would result in the direct loss of 12 agricultural jobs/year and a total of 41  
 6 agricultural jobs/year (including direct, indirect and induced effects) (Chapter 16, *Socioeconomics*,  
 7 Section 13.3.3.9, Table 16-45).

8 Because of a combination of historical and recent settlement trends, many of the agricultural areas  
 9 in the interior Delta contain high proportions of minority residents, including Hispanics, Asians, and  
 10 African-Americans. According to the report *The California Farm Labor Force Overview and Trends*  
 11 *from the National Agricultural Workers Survey*, commissioned by the EPA Region 9 Pesticide  
 12 Program, which provides the most current demographic information collected through the NAWS,  
 13 approximately 99% of California farm laborers are Hispanic (Aguirre International 2005:10), and  
 14 approximately 22% of farm labor falls below the poverty threshold (Aguirre International 2005:27).

15 Because the majority of farm labor in the study area is minority, including those of Hispanic origin,  
 16 and potentially low-income, loss of up to 57 agricultural jobs/year in the study area associated with  
 17 construction of the conveyance facilities is considered to be a disproportionate effect on an  
 18 environmental justice population. While a net increase in employment would result during  
 19 construction because of new construction jobs, these jobs would not likely be filled by displaced  
 20 agricultural workers because the skills required are not comparable. This effect would, therefore,  
 21 remain adverse because job losses would disproportionately accrue to a minority population.

### 22 **28.5.8.3 Aesthetics and Visual Resources**

23 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.9, addresses visual resources in the study  
 24 area, where proposed intake and water conveyance facilities and related structures and operations  
 25 would be located. Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.9, identifies the  
 26 following adverse effects.

#### 27 **Impact AES-1: Substantial Alteration in Existing Visual Quality or Character during** 28 **Construction of Conveyance Facilities**

#### 29 **Impact AES-2: Permanent Effects on a Scenic Vista from Presence of Conveyance Facilities**

#### 30 **Impact AES-3: Permanent Damage to Scenic Resources along a State Scenic Highway from** 31 **Construction of Conveyance Facilities**

#### 32 **Impact AES-4: Creation of a New Source of Light or Glare That Would Adversely Affect Views** 33 **in the Area as a Result of Construction and Operation of Conveyance Facilities**

#### 34 **Impact AES-6: Substantial Alteration in Existing Visual Quality or Character during** 35 **Implementation of CM2–CM22**

36 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.9, Impact AES-6, analyzes the effect of the  
 37 implementation of CM2–CM22 on aesthetic and visual resources. This effect is adverse. However  
 38 because the precise location of where future conservation measures will be implemented is  
 39 unknown, this impact is not carried forward for further analysis of environmental justice effects for  
 40 this alternative or other alternatives.

1 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.9, also identifies the following mitigation  
2 measures that would reduce the identified effects on aesthetics and visual resources.

3 **Mitigation Measure AES-1a: Locate New Transmission Lines and Access Routes to**  
4 **Minimize the Removal of Trees and Shrubs and Pruning Needed to Accommodate New**  
5 **Transmission Lines and Underground Transmission Lines Where Feasible**

6 **Mitigation Measure AES-1b: Install Visual Barriers between Construction Work Areas and**  
7 **Sensitive Receptors**

8 **Mitigation Measure AES-1c: Develop and Implement a Spoil/Borrow and Reusable Tunnel**  
9 **Material Area Management Plan**

10 **Mitigation Measure AES-1d: Restore Barge Unloading Facility Sites Once Decommissioned**

11 **Mitigation Measure AES-1e: Apply Aesthetic Design Treatments to All Structures to the**  
12 **Extent Feasible**

13 **Mitigation Measure AES-1f: Locate Concrete Batch Plants and Fuel Stations Away from**  
14 **Sensitive Visual Resources and Receptors and Restore Sites upon Removal of Facilities**

15 **Mitigation Measure AES-1g: Implement Best Management Practices to Implement Project**  
16 **Landscaping Plan**

17 **Mitigation Measure AES-4a: Limit Construction to Daylight Hours within 0.25 Mile of**  
18 **Residents**

19 **Mitigation Measure AES-4b: Minimize Fugitive Light from Portable Sources Used for**  
20 **Construction**

21 **Mitigation Measure AES-4c: Install Visual Barriers along Access Routes, Where Necessary,**  
22 **to Prevent Light Spill from Truck Headlights toward Residences**

23 **Mitigation Measure AES-6a: Underground New or Relocated Utility Lines Where Feasible**

24 **Mitigation Measure AES-6b: Develop and Implement an Afterhours Low-intensity and**  
25 **Lights off Policy**

26 **Mitigation Measure AES-6c: Implement a Comprehensive Visual Resources Management**  
27 **Plan for the Delta and Study Area**

28 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.9, Impacts AES-1 through AES-4,  
29 describe the aesthetics and visual resources effects associated with water conveyance facilities  
30 construction and operations. Impact AES-3 describes the effects on local scenic highways, such  
31 as SR 160. Because degradation of a scenic highway would result in loss of scenic qualities for all  
32 highway users, it is not carried forward for environmental justice analysis.

33 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.9, Impact AES-1, addresses the  
34 potential for construction activities to substantially alter the visual quality or character in the  
35 vicinity of project elements that can be viewed from local sensitive receptors and public viewing

1 areas. The primary features that would affect the existing visual character under Alternative 4  
2 once the facilities have been constructed would be Intakes 2, 3 and 5, the intermediate forebay  
3 and the expanded Clifton Court Forebay, resulting landscape scars effects left behind from  
4 spoil/borrow and RTM areas, transmission lines, concrete batch plants and fuel stations, and  
5 launching, retrieval, and ventilation shafts sites. Construction-related visual changes would be  
6 most evident in the northern portion of the study area, which would undergo extensive  
7 construction to build large industrial facilities and supporting infrastructure along and  
8 surrounding the Sacramento River between Clarksburg and Walnut Grove where the intakes  
9 would be situated. The intermediate forebay, expanded Clifton Court Forebay and several of the  
10 work areas adjacent to the southern portion of the conveyance alignment also would generate  
11 adverse visual effects for adjacent viewers, including residents in the communities of  
12 Clarksburg, Hood, and Walnut Grove. Clarksburg and Hood would be affected the most because  
13 they are in closer proximity to the intakes. Walnut Grove would also be affected, to a lesser  
14 degree, due to its proximity to the intermediate forebay along Twin Cities Road and  
15 ventilation/access shaft site along Walnut Grove Road. Both Twin Cities and Walnut Grove  
16 Roads serve as primary access routes to Walnut Grove from I-5.

17 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.9, Impact AES-2, describes the  
18 permanent alteration of scenic vistas resulting from construction. As described in this impact,  
19 the primary features that would affect scenic vistas subsequent to completion of construction of  
20 Alternative 4 are Intakes 2, 3 and 5, the intermediate forebay and expanded Clifton Court  
21 Forebay, landscape scars remaining from spoil/borrow and RTM areas, and transmission lines.  
22 The communities of Clarksburg and Hood would be affected the most because they are in closer  
23 proximity to the intakes. Walnut Grove would also be affected, to a lesser degree, due to its  
24 proximity to the intermediate forebay along Twin Cities Road and ventilation/access shaft site  
25 along Walnut Grove Road. Rural residences, located south of Twin Cities Road and the  
26 intermediate forebay, would have construction occurring near their homes through  
27 construction of the intermediate forebay. The Chapter 17, *Aesthetics and Visual Resources*,  
28 Section 17.3.3.9, Impact AES-4, describes the potential for new sources of light and glare that  
29 would be introduced during construction or as part of permanent features that would remain  
30 after the conveyance facilities are complete. Intakes 2, 3, and 5 and their associated pumping  
31 plants, surge towers, and facilities would introduce new surfaces that may increase glare as  
32 described in Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.9. In addition, the water  
33 surfaces of the new forebays would reflect sunlight, introducing glare. Evening and nighttime  
34 construction activities would require use of extremely bright lights and generate increased  
35 nighttime headlights flashing into nearby residents' homes; these light sources would affect  
36 adjacent populations. New facilities would also require the use of safety lighting once built.  
37 Lighting equipment associated with BDCP facilities would increase the amount of nighttime  
38 lighting along the alignment above ambient light levels. In particular, security lighting for  
39 Intakes 2, 3, and 5 and their associated pumping stations and facilities would create very  
40 noticeable effects relating to increasing nighttime light at those locations. The community of  
41 Hood would be affected.

42 While mitigation is available to reduce the effects of Impacts AES-1, AES-2, and AES-4, these  
43 effects would remain adverse. As shown in Figures 28-1 and 28-2, meaningfully greater minority  
44 and low-income populations occur throughout the study area, including along the  
45 pipeline/tunnel alignment alternative. Specifically, a concentration of minority and low-income  
46 populations are located in the communities of Clarksburg, Walnut Grove, and Hood, where

1 residential viewers in these communities would be affected by adverse visual effects of this  
2 alternative.

3 Because adverse visual effects are largely associated with the northern portion of the alignment  
4 where permanent features would remain and along the southern portion of the alignment  
5 where the expanded Clifton Court Forebay and borrow and spoil areas would be constructed,  
6 where minority and low-income populations occur, these effects would disproportionately  
7 affect these populations. For these reasons, although mitigation is available to reduce the  
8 severity of these effects, this effect would be adverse.

#### 9 **28.5.8.4 Cultural Resources**

10 Construction of conveyance facilities under this alternative would have adverse effects on  
11 prehistoric archaeological resources, unidentified human remains, historic archaeological sites,  
12 traditional cultural properties, and built environment resources, as described in Impact CUL-1  
13 through Impact CUL-7.

##### 14 **Impact CUL-1: Effects on Identified Archaeological Sites Resulting from Construction of** 15 **Conveyance Facilities**

##### 16 **Impact CUL-2: Effects on Archaeological Sites to Be Identified through Future Inventory** 17 **Efforts**

##### 18 **Impact CUL-3: Effects on Archaeological Sites That May Not Be Identified through Inventory** 19 **Efforts**

##### 20 **Impact CUL-4: Effects on Buried Human Remains Damaged during Construction**

##### 21 **Impact CUL-5: Direct and Indirect Effects on Eligible and Potentially Eligible Historic** 22 **Architectural/Built-Environment Resources Resulting from Construction Activities**

##### 23 **Impact CUL-6: Direct and Indirect Effects on Unidentified and Unevaluated Historic** 24 **Architectural/Built-Environment Resources Resulting from Construction Activities**

##### 25 **Impact CUL-7: Effects of Other Conservation Measures on Cultural Resources**

26 Chapter 18, *Cultural Resources*, Section 18.3.5.9, Impact CUL-8, addresses the compatibility of the  
27 BDCP with the adopted cultural resource management policies of agencies with land use authority in  
28 the Delta. Because this effect is not a physical environmental effect that could result in impacts on  
29 environmental justice populations, it is not relevant to this analysis.

30 Ground-disturbing construction has the potential to damage both identified and previously  
31 unrecorded examples of each of these resources. Mitigation measures are available to reduce these  
32 effects.

##### 33 **Mitigation Measure CUL-1: Prepare a Data Recovery Plan and Perform Data Recovery** 34 **Excavations on the Affected Portion of the Deposits of Identified and Significant** 35 **Archaeological Sites**

1           **Mitigation Measure CUL-2: Conduct Inventory, Evaluation, and Treatment of**  
 2           **Archaeological Resources**

3           **Mitigation Measure CUL-3: Implement an Archaeological Cultural Resources Discovery**  
 4           **Plan, Perform Training of Construction Workers, and Conduct Construction Monitoring**

5           **Mitigation Measure CUL-4: Follow State and Federal Law Governing Human Remains If**  
 6           **Such Resources Are Discovered during Construction**

7           **Mitigation Measure CUL-5: Consult with Relevant Parties, Prepare and Implement a Built**  
 8           **Environment Treatment Plan**

9           **Mitigation Measure CUL-6: Conduct a Survey of Inaccessible Properties to Assess**  
 10           **Eligibility, Determine if These Properties Will Be Adversely Impacted by the Project, and**  
 11           **Develop Treatment to Resolve or Mitigate Adverse Impacts**

12           **Mitigation Measure CUL-7: Conduct Cultural Resource Studies and Adopt Cultural**  
 13           **Resource Mitigation Measures for Cultural Resource Impacts Associated with**  
 14           **Implementation of Conservation Measures 2-22**

15           Prehistoric resources, especially sites containing human remains, are of special significance to the  
 16           Native American community. The geographic distribution of the affected resources is described in  
 17           Chapter 18, Cultural Resources, Section 18.3.5.9. The number of resources affected by each  
 18           alternative is indicated in the tables provided in Appendix 18B, Identified Cultural Resources  
 19           Potentially Affected by BDCP Alternatives. These resources represent a tangible link to the past, and,  
 20           if they contain human remains, a resting place for interred ancestors. While cultural resources and  
 21           buried human remains also contain significance for the general public (including low-income  
 22           populations), the significance to the general public is typically limited to the scientific value of the  
 23           resources. Because these resources are especially significant to Native American populations and  
 24           potentially other minority populations, adverse effects identified in Chapter 18, Cultural Resources,  
 25           Section 18.3.5.9, Impacts CUL-1 through CUL-7, would result in a disproportionate effect on  
 26           minorities. The affected population cannot always be identified with specificity because members of  
 27           tribes that attach significance to the resources in the Delta may reside in relatively remote locations  
 28           rather than in adjacent census blocks or even counties. Nonetheless, this alternative would result in  
 29           a disproportionate effect on Native American populations and potentially other minorities.

30           Identification and treatment of cultural resources would be completed under relevant mitigation  
 31           measures described in Chapter 18, *Cultural Resources*, Section 18.3.5.9 (CUL-1 through CUL-7).  
 32           Construction monitoring and discovery protocols would be performed during construction under  
 33           Mitigation Measure CUL-3. State and federal law governing discoveries of human remains would be  
 34           enforced through Mitigation Measure CUL-4. In addition to the mitigation measures proposed in this  
 35           EIS/EIR, federal agencies that have a significant role in implementing the BDCP are required to  
 36           comply with Section 106 of the National Historic Preservation Act (NHPA) (16 United States Code  
 37           [USC] 470f). Section 106 and the Section 106 regulations require that the agencies identify effects on  
 38           historic properties and consult with the public (including relevant minority groups) and Native  
 39           American tribes during the management process. Section 106 thus adds another mechanism for  
 40           identifying resources, and developing mitigation that would reduce or avoid adverse effects. Despite  
 41           these mitigation measures and consultation processes, this alternative is likely to result in adverse  
 42           effects on prehistoric archaeological resources and human remains because the scale of the

1 alternative makes avoidance of all eligible resources infeasible. In addition, because there is no  
 2 feasible way to identify buried resources that may occur in deep subterranean sections of the tunnel  
 3 in advance of construction, effects on these resources cannot be accurately identified or avoided.  
 4 The effect on minority populations that may ascribe significance to cultural resources in the Delta  
 5 would remain disproportionate even after mitigation because mitigation cannot guarantee that all  
 6 resources would be avoided, or that effects on affected resources would be reduced. For these  
 7 reasons this effect would be adverse because the effect would disproportionately accrue to a  
 8 minority population.

### 9 **28.5.8.5 Public Services and Utilities**

10 Chapter 20, *Public Services and Utilities*, Section 20.3.3.9, addresses the potential effects of the  
 11 alternative on utility infrastructure and public service providers, such as fire stations and police  
 12 facilities. Chapter 20, *Public Services and Utilities*, Section 20.3.3.9, identifies two adverse effects  
 13 under this alternative.

#### 14 **Impact UT-6: Effects on Regional or Local Utilities as a Result of Constructing the Proposed** 15 **Water Conveyance Facilities**

#### 16 **Impact UT-8: Effects on Public Services and Utilities as a Result of Implementing the** 17 **Proposed CM2–CM11**

18 Chapter 20, *Public Services and Utilities*, Section 20.3.3.9, Impact UT-6, describes the potential for  
 19 construction of this conveyance alternative to conflict with existing utility facilities in some  
 20 locations. Alternative 4 would require relocation of regional power transmission lines and natural  
 21 gas pipelines. Further, construction could disrupt utility services from damage to previously  
 22 unidentified utilities, or damage to a utility that could cause a public health hazard (e.g., gas line  
 23 explosion). Mitigation Measures UT-6a, UT-6b, and UT-6c would require verifying utility locations  
 24 prior to construction, and relocating them to avoid effects on utility operations and worker and  
 25 public health and safety. However, because relocation and potential disruption of utility  
 26 infrastructure would be required and because it is possible that not all utilities would be identified,  
 27 and that some service disruption associated with inadvertent damage would occur, this impact is  
 28 adverse. Depending on the location of service loss, minority or low-income populations might be  
 29 affected. However, because relocation of an existing known utility would affect the entire service  
 30 area of that utility, this effect would not be anticipated to result in a disproportionate effect on a  
 31 minority or low-income population. In addition, inadvertent damage to or disruption of a previously  
 32 unknown utility infrastructure would also not disproportionately affect a minority or low-income  
 33 populations because it would affect the general population of the affected service area. This is not  
 34 considered an adverse effect.

35 Chapter 20, *Public Services and Utilities*, Section 20.3.3.9, Impact UT-8, describes the potential  
 36 consequences of conservation measures on public services at a program-level of detail. The location  
 37 and construction or operational details (i.e., water consumption and water sources associated with  
 38 conservation measures) for these facilities and programs have not been developed. Therefore, the  
 39 need for new or expanded water or wastewater treatment facilities and the potential to disrupt  
 40 utilities and service in the study area is unknown. Mitigation Measures UT-6a, UT-6b, and UT-6c  
 41 would reduce the effects on utilities; however, because the effectiveness of these measures is  
 42 unknown, this impact is adverse. Because the effect topic analyzes these effects at a general level of  
 43 detail, it is not amenable to analysis to determine if it would result in an effect on an environmental

1 justice population. Project-level analysis of effects on environmental justice populations would be  
2 addressed as part of future environmental analysis for implementation of conservation measures.

### 3 **28.5.8.6 Air Quality and Greenhouse Gas Emissions**

4 As discussed under Alternative 4, Chapter 22, *Air Quality and Greenhouse Gases*, Section 22.3.3.9  
5 addresses the potential effects for a BDCP alternative to generate criteria pollutants that exceed  
6 local air quality management district thresholds from construction of the proposed water  
7 conveyance facilities and the implementation of CM2-11. The following adverse effects are relevant  
8 to this analysis.

#### 9 **Impact AQ-2: Generation of Criteria Pollutants in Excess of the SMAQMD Thresholds during** 10 **Construction of the Proposed Water Conveyance Facility**

#### 11 **Impact AQ-18: Generation of Criteria Pollutants from Implementation of CM2–CM11**

12 As described in Impact AQ-2, construction of Alternative 4 would generate fugitive dust emissions  
13 exceeding Sacramento Metropolitan Air Quality Management District (SMAQMD) thresholds. The  
14 impact of generating emissions in excess of local air district thresholds would therefore violate  
15 applicable air quality standards in the study area and could contribute to or worsen an existing air  
16 quality conditions. No feasible mitigation is available to reduce fugitive dust emissions; therefore,  
17 the effect would remain adverse.

18 As described in Impact AQ-18, implementation of CM2-11 under Alternative 4 could generate  
19 additional traffic on roads and highways in and around Suisun Marsh and the Yolo Bypass related to  
20 restoration or monitoring activities. These activities require physical changes or heavy-duty  
21 equipment that would generate construction emissions through earth-moving activities and heavy-  
22 duty diesel-powered equipment. This would result in an adverse effect if the incremental difference,  
23 or increase, of criteria pollutants relative to Existing Conditions exceeds applicable local air district  
24 thresholds. Because the conservation measures are analyzed at a program-level of detail, and have  
25 not been refined to specific projects with discrete locations, it would be difficult to analyze potential  
26 disproportionate effects on environmental justice populations. These effects are expected to be  
27 further evaluated and identified in the subsequent project-level environmental analysis conducted  
28 for the CM2–CM11 restoration and enhancement actions. However, because of the distribution of  
29 minority and low-income populations in the study area, there is a potential for such effects.  
30 Mitigation Measure AQ-18 would be available to reduce this effect.

#### 31 **Mitigation Measure AQ-18: Develop an Air Quality Mitigation Plan (AQMP) to Ensure Air** 32 **District Regulations and Recommended Mitigation are Incorporated into Future** 33 **Conservation Measures and Associated Project Activities**

34 However, it may not be sufficient to reduce emissions below applicable air quality management  
35 district thresholds. Consequently, this impact would be adverse.

36 Given that the construction and restoration and conservation areas along this alignment are  
37 proximate to census blocks and block groups where meaningfully greater minority and low-  
38 income populations occur (Figures 28-1 and 28-2), it is expected that generation of criteria  
39 pollutants in excess of local air district thresholds would result in a potentially disproportionate  
40 effect on minority and low-income populations. See Chapter 30, *Growth Inducement and Other*  
41 *Indirect Effects*, for discussion on any indirect effects on export service areas.

## 1   **28.5.8.7    Noise**

2       Chapter 23, *Noise*, Section 23.4.3.9, identifies the following adverse effects associated with new  
3       sources of noise and vibration that would be introduced into the study area under Alternative 4.

### 4       **Impact NOI-1: Exposure of Noise-Sensitive Land Uses to Noise from Construction of Water** 5       **Conveyance Facilities**

### 6       **Impact NOI-2: Exposure of Sensitive Receptors to Vibration or Groundborne Noise from** 7       **Construction of Water Conveyance Facilities**

### 8       **Impact NOI-4: Exposure of Noise-Sensitive Land Uses to Noise from Implementation of** 9       **Proposed Conservation Measures 2-22**

10       Chapter 23, *Noise*, Section 23.3.3.9, Impacts NOI-1 and NOI-2, describe vibration and noise effects  
11       associated with construction of this alternative that would occur at discrete locations along the  
12       conveyance facility, and would affect adjacent residents or other sensitive receptors. Specifically, as  
13       described in Chapter 23, *Noise*, Section 23.3.3.9, Impact NOI-1, noise from construction of intakes;  
14       construction of conveyance, forebays, barge unloading facilities, and intermediate pumping plants;  
15       truck trips and worker commutes; construction of power transmission lines; and earth-moving at  
16       offsite borrow/spoil areas is predicted to exceed daytime and nighttime noise standards in areas  
17       zoned for sensitive land uses including residential, natural/recreational, agricultural residential, and  
18       schools.

19       Groundborne vibration from impact pile driving, discussed in Chapter 23, *Noise*, Section 23.3.3.9,  
20       Impact NOI-2, is predicted to exceed vibration thresholds in areas zoned for residential, including  
21       agricultural residential, land uses in areas listed below.

- 22       • Sacramento County – including River Road near the community of Hood, neighborhoods in the  
23       community of Hood.
- 24       • San Joaquin County.

25       As shown in Figures 28-1 and 28-2, there are census blocks and block groups with meaningfully  
26       greater proportions of minority and low-income populations in the vicinity of heavy construction  
27       work areas (e.g., intake locations, the modified pipeline/tunnel alignment, and the forebays) where  
28       vibration and noise effects are predicted to exceed noise standards for nearby residents.

29       Construction of intakes and the tunnel would result in groundborne vibration and groundborne  
30       noise levels that exceed noise thresholds at nearby receptors, including residential structures. The  
31       effect of exposing sensitive receptors to vibration or groundborne noise would be adverse.

32       Chapter 23, *Noise*, Section 23.4.3.9, Impact NOI-4, describes the noise effects of conservation  
33       measures 2-22. Because these conservation measures are analyzed at a program-level of detail, and  
34       have not been refined to specific projects with discrete locations, it would be difficult to analyze  
35       potential disproportionate effects on environmental justice populations. However, because of the  
36       distribution of minority and low-income populations in the study area, there is a potential for such  
37       effects.

38       Chapter 23, *Noise*, identifies mitigation measures that would reduce noise and vibration effects.

1       **Mitigation Measure NOI-1a: Employ Noise-Reducing Construction Practices during**  
 2       **Construction**

3       **Mitigation Measure NOI-1b: Prior to Construction, Initiate a Complaint/Response**  
 4       **Tracking Program**

5       **Mitigation Measure NOI-2: Employ Vibration-Reducing Construction Practices during**  
 6       **Construction of Water Conveyance Facilities**

7       In addition, the environmental commitment to develop and implement a Noise Abatement Plan  
 8       would reduce these effects (Appendix 3B, *Environmental Commitments*). Although these  
 9       mitigation measures and environmental commitment would be available to reduce these effects,  
 10      it is not anticipated that feasible measures would be available in all situations to reduce  
 11      construction noise to levels below the applicable thresholds. The effect of exposing noise-  
 12      sensitive land uses to noise increases above thresholds is considered adverse. Although  
 13      mitigation measures are available to address this temporary effect, because the noise and  
 14      vibration effects would occur in areas with meaningfully greater minority and low-income  
 15      populations, this represents a disproportionate effect. This effect is considered adverse.

16   **28.5.8.8      Public Health**

17      Chapter 25, *Public Health*, Section 25.3.3.9, identifies the potential for the operation of this  
 18      alternative to increase concentrations of bromide and associated DPBs at Barker Slough, a source of  
 19      water for the North Bay Aqueduct:

20      **Impact PH-2: Exceedances of Water Quality Criteria for Constituents of Concern Such That**  
 21      **There Is an Adverse Effect on Public Health as a Result of Operation of the Water Conveyance**  
 22      **Facilities**

23      This would be an adverse effect because these chemicals are associated with adverse health effects.  
 24      Mitigation Measure WQ-5 is available to reduce this effect:

25      **Mitigation Measure WQ-5: Avoid, Minimize, or Offset, as Feasible, Adverse Water Quality**  
 26      **Conditions**

27      In addition, the contribution of this alternative would add to the foreseeable future increase in  
 28      DPBs that would happen in the absence of the project, as described in Chapter 25, *Public Health*,  
 29      Section 25.4. While Mitigation Measure WQ-5 may reduce this impact, the feasibility and  
 30      effectiveness of this mitigation measure is uncertain based on currently available information.  
 31      Therefore, the available mitigation would not fully reduce the impact.

32      The North Bay Aqueduct serves Napa and Solano Counties. This analysis assumes the decrease  
 33      in water quality for waters conveyed in this aqueduct would affect the entire service population  
 34      using water from the North Bay Aqueduct, which is approximately the same as the demographic  
 35      profile for each county as a whole. Napa County as a whole does not have a meaningfully greater  
 36      minority population (the total minority population is approximately 44%, U.S. Census Bureau  
 37      2012a). Solano County however has a total minority population of approximately 59% (U.S.  
 38      Census Bureau 2012b). Neither county has a meaningfully greater low-income population.  
 39      Because the increase in bromide and DPBs would decrease water quality for Solano County  
 40      service population, this would disproportionately affect minorities. This is an adverse effect.

1 Because the BDCP proponents cannot ensure that the results of coordinated actions with water  
 2 treatment entities will be fully funded or implemented successfully prior to the project's  
 3 contribution to the impact, the ability to fully mitigate this impact is uncertain. If a solution that  
 4 is identified by the BDCP proponents and an affected water purveyor is not fully funded,  
 5 constructed, or implemented before the project's contribution to the impact is made, an adverse  
 6 effect in the form of increased DBP in drinking water sources could occur. If, however, all  
 7 financial contributions, technical contributions, or partnerships required to avoid adverse  
 8 effects prove to be feasible and any necessary agreements are completed before the project's  
 9 contribution to the effect is made, the impacts would not be adverse.

### 10 **28.5.8.9 Summary of Environmental Justice Effects under Alternative 4**

11 Alternative 4 would result in disproportionate effects on minority and low-income communities  
 12 resulting from land use, socioeconomic, aesthetics and visual resources, cultural resources, noise,  
 13 and public health effects. Mitigation and environmental commitments are available to reduce these  
 14 effects; however, effects would remain adverse. For these reasons, effects on minority and low-  
 15 income populations would be disproportionate and adverse.

## 16 **28.5.9 Other Pipeline/Tunnel Alignment Alternatives** 17 **Compared with Alternative 1A**

18 Generally, the different pipeline/tunnel alignment alternatives, including Alternatives 2A, 3, 5, 6A, 7,  
 19 and 8, would have the same impact mechanisms with the associated potential for a disproportionate  
 20 effect on minority populations as described under Alternative 1A. The differences in these  
 21 alternatives for the purposes of environmental justice analysis are the locations of the physical  
 22 features and/or operational guidelines that would result in effects that contribute to a  
 23 disproportionate effect on minority and low-income populations. Figures 28-1 and 28-2 show the  
 24 distribution of minority and low-income populations in relation to the pipeline/tunnel alignment,  
 25 which includes Alternatives 2A, 3, 5, 6A, 7, and 8.

### 26 **28.5.9.1 Land Use**

27 Alternatives 2A, 3, 5, 6A, 7, and 8 would have the potential to result in the relocation of residents  
 28 (Chapter 13, *Land Use*, Impact LU-2). Alternatives 2A, 6A, and 7 have the potential to divide existing  
 29 communities (LU-3). As with Alternative 1A, the physical footprints of the intake facilities and their  
 30 associated conveyance pipelines for each of the pipeline/tunnel alignment alternatives are  
 31 anticipated to conflict with structures, including residences. The variation in number of residential  
 32 structures affected is related to the number of intakes and associated conveyance pipelines, as well  
 33 as the intake locations. Chapter 13, *Land Use*, Section 13.3.3.2, Table 13-4 summarizes the estimated  
 34 number of structures affected across structure type and alternative and Mapbook Figure M13-1  
 35 shows the distribution of these effects across the pipeline/tunnel conveyance alignment. Of all of the  
 36 pipeline/tunnel alignment alternatives, Alternative 5 would affect the fewest residential structures  
 37 (28) because only one intake would be constructed under this alternative (Intake 1). As shown in  
 38 the Figure 28-1, there are census blocks with a meaningfully greater minority population (over  
 39 50%) throughout the study area, and specifically along the pipeline/tunnel alignment. Although  
 40 construction of some alternatives would affect fewer residential structures, all of the  
 41 pipeline/tunnel alignment alternatives would result in displacement of residences associated with  
 42 the intakes and associated conveyance pipelines, which would affect census blocks where the

1 minority population is over 50%. This represents a disproportionate effect on minority populations  
2 because the effect would occur in a geographic location with meaningfully greater minority  
3 populations. When required, DWR would provide compensation to property owners for the  
4 property losses due to implementation of the alternative. Compensation would reduce the severity  
5 of economic effects related to this physical effect, but would not reduce the severity of the physical  
6 effect itself. For these reasons, this effect would be adverse.

7 With the exception of Alternatives 3 and 5, which would not cause the community of Hood to be  
8 bisected or isolated due to the location of the intakes and the smaller number of intakes associated  
9 with alternatives, construction of the other pipeline/tunnel alignment alternatives have the  
10 potential to divide the community of Hood. During the construction of the conveyance pipeline  
11 between Intake 3 and the intermediate forebay (about 0.5 mile north and south of Hood,  
12 respectively), construction activities would bisect the community of Hood, separating some of the  
13 community's easternmost structures from the main section of the community. Even though access to  
14 and from the community would be maintained over the long-term, the placement of Intake 4 and its  
15 associated facilities, as well as the nearby construction of Intake 3 and the intermediate forebay,  
16 would create lasting physical barriers between Hood and the surrounding lands. While a permanent  
17 physical division within the community itself is not anticipated to result from these features,  
18 activities associated with their construction would create divisions over a multiyear period.  
19 Mitigation Measures TRANS-1a and TRANS-1b are available to address this effect. However, these  
20 divisions and physical barriers between the community of Hood and its surroundings constitute an  
21 adverse effect. As shown in Figures 28-1 and 28-2, the community of Hood is comprised of census  
22 blocks with both a meaningfully greater minority population (over 50%) and block groups with low-  
23 income populations. As such, the division of the community of Hood would have a  
24 disproportionately adverse effects on minority and low-income populations in Hood. This would be  
25 an adverse effect, because it would disproportionately accrue to minority and low-income  
26 populations.

## 27 **28.5.9.2 Socioeconomics**

28 The same impact mechanisms identified for Alternative 1A would also contribute to a  
29 disproportionate effect associated with loss of agricultural jobs under Alternatives 2A, 3, 5, 6A, 7,  
30 and 8. Table 28-2 compares the effect on employment gains and losses across the pipeline/tunnel  
31 alignment alternatives for construction and operations phases. This table provides relevant  
32 employment data from Chapter 16, *Socioeconomics*.

1 **Table 28-2. Comparison of Pipeline/Tunnel Alignment Alternatives and Effects on Employment**

*Alternative	Construction phase, jobs gained (peak)	Construction phase, agricultural jobs lost	Operation phase, jobs gained (peak)	Operation phase, agricultural jobs lost
2A	4,390/12,716 (direct/total, same as 1A)	27/100 (direct/total, same as 1A)	187/269 (direct/total, same as 1A)	31/86 (direct/total, same as 1A)
3	2,849/10,297 (direct/total)	23/88 (direct/total)	Same as 1A	Same as 1A
5	1,372/5,073 (direct/total)	22/83 (direct/total)	Same as 1A	Same as 1A
6A	Same as 1A	Same as 1A	Same as 1A	Same as 1A
7	3,360/11,018 (direct/total)	25/94 (direct/total)	Same as 1A	Same as 1A
8	Same as 7	Same as 7	Same as 1A	Same as 1A

\*data compiled from Chapter 16, *Socioeconomics*

2

3 Because the majority of farm labor in the study area is minority, including those of Hispanic origin  
4 and potentially low-income, loss of agricultural jobs as projected for the study area (Table 28-2)  
5 associated with construction of the conveyance facility is considered to be a disproportionate effect  
6 on an environmental justice population. However, the overall employment effect in the study area  
7 related to construction and operation of the conveyance facility would be an increase in  
8 construction and facility operation employment which may have some unknown positive effect on  
9 the environmental justice population in the study area. Despite the potential for a beneficial  
10 employment effect in the study area under these alternatives, the disproportionate effect on  
11 agricultural workers is considered an adverse effect because this effect would be predominately  
12 borne by a minority population currently employed by the agricultural industry in the study area.

### 13 **28.5.9.3 Aesthetics and Visual Resources**

14 Alternatives 2A, 3, 5, 6A, 7, and 8 would result in adverse effects on aesthetics and visual resources  
15 in the vicinity of each alignment. While the exact footprint of each alternative, and thus the affected  
16 population varies slightly for each alternative, the same impact mechanisms and mitigation  
17 measures as those described under Alternative 1A would be applicable to the other pipeline/tunnel  
18 alignment alternatives. Because minority and low-income populations are distributed along all of  
19 these alternatives (see Figures 28-1 and 28-2), intermittently, from north to south, the primary  
20 distinction between alternatives is the location and number of intake facilities. The contribution of  
21 aesthetic effects on disproportionate effects on minorities therefore varies primarily based upon the  
22 location and number of intakes. The number of intakes associated with each alternative is  
23 summarized in Table 28-3.

1 **Table 28-3. Intake Locations by BDCP Alternative**

BDCP Alternative	Intakes
<b>Pipeline/Tunnel Alignment Alternatives</b>	
1A	1, 2, 3, 4, 5
2A	1, 2, 3, 4, 5 (or 1, 2, 3, 6, 7)
3	1, 2
5	1
6A	1, 2, 3, 4, 5
7	2, 3, 5
8	2, 3, 5
<b>East Alignment Alternatives</b>	
1B	1, 2, 3, 4, 5
2B	1, 2, 3, 4, 5 (or 1, 2, 3, 6, 7)
6B	1, 2, 3, 4, 5
<b>West Alignment Alternatives</b>	
1C	West side intakes 1, 2, 3, 4, 5
2C	West side intakes 1, 2, 3, 4, 5
6C	West side intakes 1, 2, 3, 4, 5

2

3 While mitigation is available to reduce these effects, these effects would remain adverse despite  
4 implementation of mitigation. Because these impact mechanisms would affect geographic units with  
5 meaningfully greater minority and low-income populations, where these effects overlap with  
6 meaningfully greater minority and low-income populations (Figures 28-1 and 28-2) these effects  
7 would contribute to a disproportionate effect on the same populations. For these reasons, although  
8 mitigation is available to reduce the severity of these effects, these effects would be adverse, because  
9 they would disproportionately accrue to minority and low-income populations.

10 **28.5.9.4 Cultural Resources**

11 Construction under Alternatives 2A, 3, 5, 6A, 7, and 8 have the potential to result in effects on  
12 identified and previously unidentified archaeological resources, built environment resources, and  
13 traditional cultural properties. The impact mechanisms and mitigation measures for cultural  
14 resources described under Alternative 1A would also be applicable to these pipeline/tunnel  
15 alignment alternatives.

16 The geographic distribution of the affected resources is described in Chapter 18, *Cultural Resources*.  
17 The number of resources affected by each alternative is indicated in the tables provided in Appendix  
18 18B, *Identified Cultural Resources Potentially Affected by BDCP Alternatives*. The pipeline/tunnel  
19 alignment alternatives are generally similar in the number of identified resources that would be  
20 affected, as well as anticipated effects on resources that have not been identified. Implementation of  
21 the mitigation measures and Section 106 consultation (see discussion under Alternative 1A, Cultural  
22 Resources) do not guarantee these effects could be reduced or avoided. The effect on Native  
23 American and other minority populations would remain disproportionate even after mitigation  
24 because mitigation cannot guarantee that all resources would be avoided, or that effects on affected  
25 resources would be reduced. For these reasons this effect would be adverse, because it would  
26 disproportionately accrue to minority populations.

### 28.5.9.5 Public Services and Utilities

Construction under the pipeline/tunnel alignment alternatives that include construction of the conveyance pipeline between Intake 3 and the intermediate forebay (Alternatives 2A, 6A, 7, and 8) would have the potential to conflict with the Hood Fire Station in Hood. The same mitigation measure as described under Alternative 1A, Mitigation Measure UT-2, would ensure that fire protection services are not interrupted. However, the potential effects of constructing a new fire station are unknown and would be considered adverse. The affected communities of Hood and Courtland are comprised of a meaningfully greater minority population, as shown on Figure 28-1, which would be potentially affected by both the disruption of fire protection or emergency medical services associated with removal of the Hood Fire Station, and the potential adverse effects of constructing a new fire station. As such, this represents a potentially disproportionate effect on minority populations. This is considered an adverse effect because it would occur in a geographic location with a meaningfully greater minority population.

The impact mechanisms and mitigation measures for construction of the proposed water conveyance facilities (Chapter 20, *Public Services and Utilities*, Impact UT-6) under the pipeline/tunnel alignment alternatives (Alternatives 2A, 3, 5, 7, and 8) would be the same as described for Alternative 1A. Chapter 20, *Public Services and Utilities*, Impact UT-6 describes the potential for construction conflict with existing utility facilities in some locations. These alternatives would require relocation of regional power transmission lines and one natural gas pipeline. Additionally, active gas wells may need to be plugged and abandoned. Further, construction could disrupt utility services from damage to previously unidentified utilities, or damage to a utility that could cause a public health hazard (e.g., gas line explosion). Mitigation Measures UT-6a, UT-6b, and UT-6c would require verifying utility locations prior to construction, and relocating them to avoid effects on utility operations and worker and public health and safety. However, because relocation and potential disruption of utility infrastructure would be required and because it is possible that not all utilities would be identified, and that some service disruption associated with inadvertent damage would occur, this impact is adverse. Depending on the location of service loss, minority or low-income populations might be affected. However, because relocation of an existing known utility would affect the entire service area of that utility this effect would not be anticipated to result in a disproportionate effect on a minority or low-income population. In addition, inadvertent damage to or disruption of a previously unknown utility infrastructure would also not disproportionately affect a minority or low-income populations because it would affect the general population of the affected service area. This is not considered an adverse effect.

Chapter 20, *Public Services and Utilities*, Impact UT-8 describes the potential consequences of conservation measures on public services at a program-level of detail. The location and construction or operational details (i.e., water consumption and water sources associated with conservation measures) for these facilities and programs have not been developed. Therefore, the need for new or expanded water or wastewater treatment facilities and the potential to disrupt utilities and service in the study area is unknown. Mitigation Measures UT-6a, UT-6b, and UT-6c would reduce the effects on utilities; however, because the effectiveness of these measures is unknown, this impact is adverse. Because the effect topic analyzes these effects at a general level of detail, it is not amenable to analysis to determine if it would result in an effect on an environmental justice population. Project-level analysis of effects on environmental justice populations would be addressed as part of future environmental analysis for implementation of conservation measures.

1 creates the potential for mercury-related health effects on these populations. Asian, African-  
 2 American, and Hispanic subsistence fishers pursuing fish in the Delta already consume fish in  
 3 quantities that exceed the US Environmental Protection Agency reference dose of 7 micrograms  
 4 ( $\mu\text{g}$ ) per day total (Shilling et al. 2010:5). This reference dose is set at 1/10 of the dose  
 5 associated with measurable health impacts (Shilling et al. 2010:6). The highest rates of mercury  
 6 intake from Delta fish occur among Lao fishers (26.5  $\mu\text{g}$  per day, Shilling et al. 2010:6). Increased  
 7 mercury was modeled based upon increases modeled for one species: largemouth bass. These  
 8 effects are considered unmitigable (see Chapter 8, *Water Quality*, Mitigation Measure WQ-13).

9 The associated increase in human consumption of mercury caused by these alternatives would  
 10 depend upon the selection of the fishing location (and associated local fish body burdens), and  
 11 the relative proportion of different Delta fish consumed. Different fish species would suffer  
 12 bioaccumulation at different rates associated with the specific species, therefore the specific  
 13 spectrum of fish consumed by a population would determine the effect of increased mercury  
 14 body burdens in individual fish species. These confounding factors make demonstration of  
 15 precise impacts on human populations infeasible. However, because minority populations are  
 16 known to practice subsistence fishing and consume fish exceeding US EPA reference doses, any  
 17 increase in the fish body burden of mercury may contribute to an existing adverse effect.  
 18 Because subsistence fishing is specifically associated with minority populations in the Delta  
 19 compared to the population at large this effect would be disproportionate on those populations  
 20 for Alternatives 6A, 7, and 8. This effect would be adverse.

21 This effect would not be adverse for other pipeline/tunnel alignment alternatives.

### 22 **28.5.9.9 Summary of Environmental Justice Effects under Other** 23 **Pipeline/Tunnel Alignment Alternatives**

24 Implementation of Alternatives 2A, 3, 5, 6A, 7, and 8 would result in disproportionate effects on  
 25 minority and low-income communities resulting from land use, socioeconomics, aesthetics and  
 26 visual resources, cultural resources, public services and utilities, noise, and public health effects. The  
 27 same mitigation measures and environmental commitments described under Alternative 1A would  
 28 reduce the severity of these effects, but would not entirely avoid these effects. Because these effects  
 29 would result in disproportionate effects on minority and low-income populations, these effects  
 30 would be adverse, because they would disproportionately accrue to minority and low-income  
 31 populations.

### 32 **28.5.10 Other East Alignment Alternatives Compared with** 33 **Alternative 1B**

34 Generally, the different east alignment alternatives, specifically, Alternatives 2B and 6B, would have  
 35 the same impact mechanisms with the associated potential for a disproportionate effect on minority  
 36 populations as described under Alternative 1B. The differences in these alternatives for the  
 37 purposes of environmental justice analysis are the locations of the physical features and/or  
 38 operational guidelines that would result in effects that contribute to a disproportionate effect on  
 39 minority and low-income populations. Because each alternative has a slightly different footprint, the  
 40 contribution of each alternative to effects on adjacent environmental justice populations varies.  
 41 Figures 28-1 and 28-2 show the distribution of minority and low-income populations in relation to  
 42 the east alignment, which includes Alternatives 2B and 6B.

### 1 **28.5.10.1 Land Use**

2 Alternatives 2B and 6B would also have the potential to result in the relocation of residents, or a  
 3 physical effect on existing structures, resulting in adverse effects on the physical environment. As  
 4 with Alternative 1B, the physical footprints of the intake facilities and their associated conveyance  
 5 pipelines for each of the east alignment alternatives are anticipated to conflict with structures,  
 6 including residences. Chapter 13, *Land Use*, Section 13.3.3.2, Table 13-4 summarizes the estimated  
 7 number of structures affected across structure type and alternative and Mapbook Figure M13-2  
 8 shows the distribution of these effects across the east conveyance alignment. The variation in  
 9 number of residential structures affected is related to the location of intakes and their associated  
 10 conveyance pipelines (e.g., Alternative 2B involves construction of Intakes 1–5 or 1–3, 6 and 7—  
 11 whereas Alternative 6B involves the same intake locations as Alternative 1B—Intakes 1–5).  
 12 Whereas Alternative 6B would affect the same number of residential structures as Alternative 1B  
 13 (i.e., approximately 106 residences), Alternative 2B would affect approximately 120 residential  
 14 structures. As shown in the Figure 28-1, there are census blocks with a meaningfully greater  
 15 minority population (over 50%) throughout the study area. Construction of east alignment  
 16 alternatives would result in displacement of residences associated with the intakes and associated  
 17 conveyance pipelines, which would affect census blocks where the minority population is over 50%.  
 18 This represents a disproportionate effect on minority populations. DWR would provide  
 19 compensation to property owners for the property losses due to implementation of the alternative.  
 20 Compensation would reduce the severity of economic effects related to this physical effect, but  
 21 would not reduce the severity of the physical effect itself. For these reasons, this effect would be  
 22 adverse.

23 As with Alternative 1B, under Alternatives 2B and 6B, construction activities associated with Intake  
 24 4 (if built under Alternative 2B) and its associated facilities, the canal, and a bridge over the canal  
 25 would separate the community of Hood from surrounding areas. Even though access to and from the  
 26 community would be maintained over the long-term, the placement of Intake 4 and the canal, as well  
 27 as the nearby construction of Intake 3, would create lasting physical barriers between Hood and the  
 28 surrounding lands. Additionally, construction and the long-term placement of Intake 3 (about 0.5  
 29 mile north of Hood) and the canal (running north to south) would create further divisions between  
 30 Hood and the surrounding lands. While a permanent physical division within the community itself is  
 31 not anticipated to result from these features, activities associated with their construction would  
 32 create divisions over a multiyear period. Additionally, the lasting placement of the intake facilities  
 33 and the canal would establish physical barriers between the community and its surroundings,  
 34 constituting an adverse effect. Mitigation Measures TRANS-1a and TRANS-1b are available to  
 35 address this effect. As shown in Figures 28-1 and 28-2, the community of Hood is composed of both  
 36 census blocks with a meaningfully greater minority population (over 50%) and block groups with  
 37 low-income populations. Consequently, the division of the community of Hood would have a  
 38 disproportionately adverse effects on minority and low-income populations in Hood. This would be  
 39 an adverse effect, because it would disproportionately accrue to minority and low-income  
 40 populations.

### 41 **28.5.10.2 Socioeconomics**

42 The same impact mechanisms identified for Alternative 1B would also contribute to a  
 43 disproportionate effect associated with loss of agricultural jobs under Alternatives 2B and 6B.  
 44 Chapter 16, *Socioeconomics*, indicates that the same number of jobs would be gained for the  
 45 construction sector and lost in the agricultural sector under these alternatives as described for 1B.

1 While each east canal alternative would result in a net increase in jobs during construction and  
2 operations, each would result in the loss of jobs in the agricultural sector. Despite the potential for a  
3 beneficial employment effect in the study area under these alternatives, the disproportionate effect  
4 on agricultural workers is considered an adverse effect because this effect would be predominately  
5 borne by a minority population currently employed by the agricultural industry in the study area.

### 6 **28.5.10.3 Aesthetics and Visual Resources**

7 Construction of the east alignments under Alternatives 2B and 6B would result in adverse effects on  
8 aesthetics and visual resources in the vicinity of each alignment similar to effects described for  
9 Alternative 1B. While Alternative 6B is substantially similar to Alternative 1B, Alternative 2B may  
10 substitute Intakes 6 and 7 for Intakes 4 and 5 and would include construction of an operable barrier  
11 at the head of Old River.

12 Because identified impact mechanisms would affect geographic units with meaningfully greater  
13 minority and low-income populations (see Figures 28-1 and 28-2), these effects would contribute to  
14 a disproportionate effect on the same populations. For these reasons, although mitigation is  
15 available to reduce the severity of these effects, these effects would be adverse, because they would  
16 occur in a geographic location with meaningfully greater minority and low-income populations.

### 17 **28.5.10.4 Cultural Resources**

18 All of the east alignment alternatives have the potential to result in effects on identified and  
19 previously unidentified archaeological resources, built environment resources, and traditional  
20 cultural properties. The impact mechanisms and mitigation measures for cultural resources  
21 described under Alternative 1B would also be applicable to the all of the east alignment alternatives.

22 The geographic distribution of the affected resources is described in Chapter 18, *Cultural Resources*.  
23 The number of resources affected by each alternative is indicated in the tables provided in Appendix  
24 18B, *Identified Cultural Resources Potentially Affected by BDCP Alternatives*. Effects on archaeological  
25 and historic-era built environment resources are very similar across east alignment options in terms  
26 of the number of affected resources. Implementation of the mitigation measures and Section 106  
27 consultation (see discussion under Alternative 1A, Cultural Resources) do not guarantee these  
28 effects could be reduced or avoided. The effect on Native American populations and other minority  
29 groups would remain even after mitigation because mitigation cannot guarantee that all resources  
30 would be avoided, or that effects on affected resources would be reduced. For these reasons this  
31 effect would be adverse, because it would disproportionately accrue to minority and low-income  
32 populations.

### 33 **28.5.10.5 Public Services and Utilities**

34 Construction under the east alignment alternatives that include construction of the canal segment  
35 and bridge (Alternatives 1B, 2B, and 6B) would have the potential to conflict with the Hood Fire  
36 Station in Hood. The same mitigation measure as described under Alternative 1A, Mitigation  
37 Measure UT-2, would ensure that fire protection services are not interrupted. However, the  
38 potential effects of constructing a new fire station are unknown and would be considered adverse.  
39 The affected communities of Hood and Courtland are composed of a meaningfully greater minority  
40 population, as shown on Figure 28-1, which would be potentially affected by both the disruption of  
41 fire protection or emergency medical services associated with removal of the Hood Fire Station, and

1 the potential adverse effects of constructing a new fire station. Consequently, this would result in a  
 2 potentially disproportionate effect on a minority population because the affected community is  
 3 predominantly minority. This is considered an adverse effect.

4 The impact mechanisms and mitigation measures for construction of the proposed water  
 5 conveyance facilities (Chapter 20, *Public Services and Utilities*, Impact UT-6) under the east  
 6 alignment alternatives (Alternatives 2B and 6B) would be the same as described for Alternative 1B.  
 7 Chapter 20, *Public Services and Utilities*, Impact UT-6, describes the potential for construction  
 8 conflict with existing utility facilities in some locations. These alternatives would require relocation  
 9 of regional power transmission lines and one natural gas pipeline. Additionally, active gas wells may  
 10 need to be plugged and abandoned. Further, construction could disrupt utility services from damage  
 11 to previously unidentified utilities, or damage to a utility that could cause a public health hazard  
 12 (e.g., gas line explosion). Mitigation Measures UT-6a, UT-6b, and UT-6c would require verifying  
 13 utility locations prior to construction, and relocating them to avoid effects on utility operations and  
 14 worker and public health and safety. However, because relocation and potential disruption of utility  
 15 infrastructure would be required and because it is possible that not all utilities would be identified,  
 16 and that some service disruption associated with inadvertent damage would occur, this impact is  
 17 adverse. Depending on the location of service loss, minority or low-income populations might be  
 18 affected. However, because relocation of an existing known utility would affect the entire service  
 19 area of that utility this effect would not be anticipated to result in a disproportionate effect on a  
 20 minority or low-income population. In addition, inadvertent damage to or disruption of a previously  
 21 unknown utility infrastructure would also not disproportionately affect a minority or low-income  
 22 populations because it would affect the general population of the affected service area. This is not  
 23 considered an adverse effect.

24 Chapter 20, *Public Services and Utilities*, Impact UT-8, describes the potential consequences of  
 25 conservation measures on public services at a program-level of detail. The location and construction  
 26 or operational details (i.e., water consumption and water sources associated with conservation  
 27 measures) for these facilities and programs have not been developed. Therefore, the need for new or  
 28 expanded water or wastewater treatment facilities and the potential to disrupt utilities and service  
 29 in the study area is unknown. Mitigation Measures UT-6a, UT-6b, and UT-6c would reduce the  
 30 effects on utilities; however, because the effectiveness of these measures is unknown, this impact is  
 31 adverse. Because the effect topic analyzes these effects at a general level of detail, it is not amenable  
 32 to analysis to determine if it would result in an effect on an environmental justice population.  
 33 Project-level analysis of effects on environmental justice populations would be addressed as part of  
 34 future environmental analysis for implementation of conservation measures.

### 35 **28.5.10.6 Air Quality and Greenhouse Gas Emissions**

36 Construction of the proposed water conveyance facilities and implementation of the conservation  
 37 measures under Alternatives 2B and 6B would generate the same criteria pollutant exceedances of  
 38 air quality district and federal *de minimis* thresholds as Alternative 1B. Although mitigation  
 39 measures are available to reduce these effects, they may not be sufficient to reduce the emissions  
 40 below applicable air quality management district thresholds. Given that the proposed water  
 41 conveyance facilities and restoration and conservation areas along these alignments are proximate  
 42 to census blocks and block groups where meaningfully greater minority and low-income  
 43 populations occur (Figures 28-1 and 28-2), it is expected that the generation of criteria pollutants in  
 44 excess of local air district and federal *de minimis* thresholds would result in a potentially  
 45 disproportionate effect on minority and low-income populations. This effect is considered adverse.

1 See Chapter 30, *Growth Inducement and Other Indirect Effects*, for discussion on any indirect effects  
2 on export service areas.

### 3 **28.5.10.7 Noise**

4 Construction of the Alternatives 2B and 6B water conveyance facilities and conservation measures  
5 would generate the same noise effects as described under Alternative 1B. Where these noise effects  
6 would overlap with census blocks or block groups with meaningfully greater minority or low-  
7 income communities they would result in a disproportionate effect on those populations. Although  
8 mitigation measures and an environmental commitment are available to address this temporary  
9 effect, because the noise and vibration effects would occur in areas with meaningfully greater  
10 minority and low-income populations, this represents a disproportionate effect. This effect is  
11 considered adverse because it would occur in a geographic location with a meaningfully greater  
12 minority population.

### 13 **28.5.10.8 Public Health**

14 Chapter 25, *Public Health*, identifies the potential for the operation of all east alignment alternatives  
15 to increase concentrations of bromide and associated DPBs at Barker Slough, a source of water for  
16 the North Bay Aqueduct. Mitigation would reduce but not avoid this effect (as described in Chapter  
17 25, *Public Health*, Mitigation Measure WQ-5). In addition, the contribution of all east alignment  
18 alternatives would add to the foreseeable future increase in DPBs that would happen in the absence  
19 of the project, as described in Chapter 25, *Public Health*, Section 25.4. Because the increase in  
20 bromide and DPBs would decrease water quality for Solano County service area, a service area with  
21 a meaningfully greater minority population, this would disproportionately affect minorities. This is  
22 an adverse effect.

23 In addition, Chapter 25, *Public Health*, Section 25.3.3.12, also analyzed the potential for operations  
24 under Alternative 6B to increase the body burden of mercury in fish relative to Existing Conditions:

#### 25 **Impact PH-3: Substantial Mobilization or Increase in Constituents Known to Bioaccumulate** 26 **as a Result of Construction, Operation or Maintenance of the Water Conveyance Facilities**

27 Fish tissue mercury concentrations showed substantial increases in some Delta locations modeled  
28 (Franks Tract and Rock Slough). Because minority populations are known to practice subsistence  
29 fishing and consume fish exceeding US EPA reference doses (Shilling et al. 2010), any increase in the  
30 fish body burden of mercury may contribute to an existing adverse effect. These effects are  
31 considered unmitigable (see Chapter 8, *Water Quality*, Section 8.3.3.12, Impact WQ-13).

32 Because subsistence fishing is specifically associated with minority populations in the Delta  
33 compared to the population at large this effect would be disproportionate on those populations for  
34 Alternative 6B. This effect would be adverse. This effect would not be adverse for other east  
35 alignment alternatives (1B and 2B).

### 36 **28.5.10.9 Summary of Environmental Justice Effects under Other East** 37 **Alignment Alternatives**

38 Implementation of Alternatives 2B and 6B would result in disproportionate effects on minority and  
39 low-income communities resulting from land use, socioeconomics, aesthetics and visual resources,  
40 cultural resources, public services and utilities, air quality and greenhouse gas emissions, noise, and

1 public health effects. The same mitigation measures and environmental commitments described  
2 under Alternative 1B would reduce the severity of these effects, but not entirely avoid these effects.  
3 Because these effects would result in disproportionate effects on minority and low-income  
4 populations, these effects would be adverse.

## 5 **28.5.11 Other West Alignment Alternatives Compared with** 6 **Alternative 1C**

7 Generally, the other west alignment alternatives, Alternatives 2C and 6C, would have the same  
8 impact mechanisms with the associated potential for a disproportionate effect on minority  
9 populations as described under Alternative 1C. The differences in these alternatives for the  
10 purposes of environmental justice analysis are the locations of the physical features and/or  
11 operational guidelines that would result in effects that contribute to a disproportionate effect on  
12 minority and low-income populations. Figures 28-1 and 28-2 show the distribution of minority and  
13 low-income populations in relation to the west alignment, which includes Alternatives 2C and 6C.

### 14 **28.5.11.1 Land Use**

15 Alternatives 2C and 6C would also have the potential to result in the relocation of residents, or a  
16 physical effect on existing structures, resulting in adverse effects on the physical environment. As  
17 with Alternative 1C, the physical footprints of the intake facilities, their associated conveyance  
18 pipelines, and canal segments for each of the west alignment alternatives are anticipated to conflict  
19 with structures, including residences. Chapter 13, *Land Use*, Section 13.3.3.2, Table 13-4,  
20 summarizes the estimated number of structures affected across structure type and alternative and  
21 Mapbook Figure M13-3 shows the distribution of these effects across the west conveyance  
22 alignment. All of the west alignment alternatives are expected to affect a similar number of  
23 residential structures because there is no variation in intake locations (i.e., all west alignment  
24 alternatives involve construction of Intakes W1–W5). Therefore, Alternatives 2C and 6C would also  
25 affect approximately 194 residences. As shown in the Figures 28-1 and 28-2, there are census blocks  
26 with a meaningfully greater minority population (over 50%) and block groups with low-income  
27 populations throughout the study area, and specifically along the west alignment. Construction of  
28 west alignment alternatives would result in displacement of residences associated with the intakes,  
29 their associated conveyance pipelines, and canal segments, which would affect census blocks where  
30 the minority population is over 50%. This represents a disproportionate effect on minority  
31 populations. DWR would provide compensation to property owners for property losses due to  
32 implementation of the alternative, which would reduce the severity of economic effects related to  
33 this physical effect, but would not reduce the severity of the physical effect itself. For these reasons,  
34 this effect would be adverse.

35 Under this alternative, construction activities associated with Intakes W1 and W2, their associated  
36 facilities, and segments of conveyance pipeline would separate the community of Clarksburg from  
37 surrounding areas. Even though access to and from the community would be maintained over the  
38 long-term, the placement of Intake W2, as well as the nearby construction of Intake W1, would  
39 create lasting physical barriers between Clarksburg and the surrounding lands. The long-term  
40 placement of Intake W2 (adjacent to the south) and Intake W1 (approximately 1 mile north) would  
41 create further divisions between Clarksburg and the surrounding lands. While a permanent physical  
42 division within the community itself is not anticipated to result from these features, activities  
43 associated with their construction would create divisions over a multiyear period. Additionally, the

1 permanent placement of the intake facilities and the canal would establish physical barriers  
 2 between the community and its surroundings, constituting an adverse effect. Mitigation Measures  
 3 TRANS-1a and TRANS-1b are available to address this effect.

4 As shown in Figures 28-1 and 28-2, the community of Clarksburg is composed of census blocks with  
 5 both a meaningfully greater minority population (over 50%) and block groups with low-income  
 6 populations. As such, the division of the community of Clarksburg would have a disproportionately  
 7 adverse effect on minority and low-income populations in the community. This would be an adverse  
 8 effect, because it would disproportionately accrue to minority and low-income populations.

### 9 **28.5.11.2 Socioeconomics**

10 The same impact mechanisms identified for Alternative 1C would also contribute to a  
 11 disproportionate effect associated with loss of agricultural jobs under Alternatives 2C and 6C.  
 12 Chapter 16, *Socioeconomics*, indicates that the same number of jobs would be gained for the  
 13 construction sector and lost in the agricultural sector under these alternatives as described for 1C.

14 While each west canal alternative would result in a net increase in jobs during construction and  
 15 operations, each would result in the loss of jobs in the agricultural sector. Despite the potential for a  
 16 beneficial employment effect in the study area under these alternatives, the disproportionate effect  
 17 on agricultural workers is considered an adverse effect because this effect would be predominately  
 18 borne by a minority population currently employed by the agricultural industry in the study area.

### 19 **28.5.11.3 Aesthetics and Visual Resources**

20 Construction of the west alignment under Alternatives 2C and 6C, would result in adverse effects on  
 21 aesthetics and visual resources in the vicinity of each alignment. These effects would be  
 22 substantially similar to effects described for Alternative 1C (for example the same intakes would be  
 23 constructed across all alternatives). Alternative 2C would also involve construction and operation of  
 24 an operable barrier at the head of Old River.

25 Because these impact mechanisms would affect geographic units with meaningfully greater minority  
 26 and low-income populations (Figures 28-1 and 28-2), these effects would contribute to a  
 27 disproportionate effect on the same populations. For these reasons, although mitigation is available  
 28 to reduce the severity of these effects, these effects would be adverse, because the effects would  
 29 occur in a geographic location with a meaningfully greater minority and low-income population.

### 30 **28.5.11.4 Cultural Resources**

31 All of the west alignment alternatives have the potential to result in effects on identified and  
 32 previously unidentified archaeological resources and potentially buried human remains. The impact  
 33 mechanisms and mitigation measures for cultural resources described under Alternative 1C would  
 34 also be applicable to the all the west alignment alternatives.

35 The geographic distribution of the affected resources is described in Chapter 18, *Cultural Resources*.  
 36 The number of resources affected by each alternative is indicated in the tables provided in Appendix  
 37 18B, *Identified Cultural Resources Potentially Affected by BDCP Alternatives*. The west alignment  
 38 alternatives are generally similar in terms of the number and distribution of affected cultural  
 39 resources. Implementation of the mitigation measures and Section 106 consultation (see discussion  
 40 under Alternative 1A, Cultural Resources) do not guarantee these effects could be reduced or

1 avoided. The effect on Native American populations and other minority groups would remain  
 2 disproportionate even after mitigation because mitigation cannot guarantee that all resources  
 3 would be avoided, or that effects on affected resources would be reduced. For these reasons this  
 4 effect would be adverse, because it would disproportionately accrue to minority and low-income  
 5 populations.

### 6 **28.5.11.5 Public Services and Utilities**

7 As with Alternative 1C, construction under the west alignment alternatives (2C and 6C) would not  
 8 displace or affect any public facilities (Chapter 20, *Public Services and Utilities*, Impact UT-2).

9 The impact mechanisms and mitigation measures for construction of the proposed water  
 10 conveyance facilities (Chapter 20, *Public Services and Utilities*, Impact UT-6) under the west  
 11 alignment alternatives (Alternatives 2C and 6C) would be the same as described for Alternative 1C.  
 12 Chapter 20, *Public Services and Utilities*, Impact UT-6, describes the potential for construction  
 13 conflict with existing utility facilities in some locations. These alternatives would require relocation  
 14 of regional power transmission lines and one natural gas pipeline. Additionally, active gas wells may  
 15 need to be plugged and abandoned. Further, construction could disrupt utility services from damage  
 16 to previously unidentified utilities, or damage to a utility that could cause a public health hazard  
 17 (e.g., gas line explosion). Mitigation Measures UT-6a, UT-6b, and UT-6c would require verifying  
 18 utility locations prior to construction, and relocating them to avoid effects on utility operations and  
 19 worker and public health and safety. However, because relocation and potential disruption of utility  
 20 infrastructure would be required and because it is possible that not all utilities would be identified,  
 21 and that some service disruption associated with inadvertent damage would occur, this impact is  
 22 adverse. Depending on the location of service loss, minority or low-income populations might be  
 23 affected. However, because relocation of an existing known utility would affect the entire service  
 24 area of that utility this effect would not be anticipated to result in a disproportionate effect on a  
 25 minority or low-income population. In addition, inadvertent damage to or disruption of a previously  
 26 unknown utility infrastructure would also not disproportionately affect a minority or low-income  
 27 populations because it would affect the general population of the affected service area. This is not  
 28 considered an adverse effect.

29 Chapter 20, *Public Services and Utilities*, Impact UT-8, describes the potential consequences of  
 30 implementation of various conservation measures on public services at a program-level of detail.  
 31 The location and construction or operational details (i.e., water consumption and water sources  
 32 associated with conservation measures) for these facilities and programs have not been developed.  
 33 Therefore, the need for new or expanded water or wastewater treatment facilities and the potential  
 34 to disrupt utilities and service in the study area is unknown. Mitigation Measures UT-6a, UT-6b, and  
 35 UT-6c would reduce adverse effect on utilities; however, because the effectiveness of these  
 36 measures is unknown, this impact would remain adverse. Because the effect topic analyzes these  
 37 effects at a general level of detail, it is not amenable to analysis to determine if it would result in an  
 38 effect on an environmental justice population. Project-level analysis of effects on environmental  
 39 justice populations would be addressed as part of future environmental analysis for implementation  
 40 of conservation measures.

### 41 **28.5.11.6 Air Quality and Greenhouse Gas Emissions**

42 Construction of the proposed water conveyance facilities and implementation of the conservation  
 43 measures under Alternatives 2C and 6C would generate the same criteria pollutant exceedances of

1 air quality district and federal *de minimis* thresholds as Alternative 1C. Although mitigation  
2 measures are available to reduce these effects, they may not be sufficient to reduce the emissions  
3 below applicable air quality management district thresholds. Given that the proposed water  
4 conveyance facilities and restoration and conservation areas along these alignments are proximate  
5 to census blocks and block groups where meaningfully greater minority and low-income  
6 populations occur (Figures 28-1 and 28-2), it is expected that the generation of criteria pollutants in  
7 excess of local air district and federal *de minimis* thresholds would result in a potentially  
8 disproportionate effect on minority and low-income populations. This effect is considered adverse.  
9 See Chapter 30, *Growth Inducement and Other Indirect Effects*, for discussion on any indirect effects  
10 on export service areas.

### 11 **28.5.11.7 Noise**

12 Construction of the Alternatives 2C and 6C water conveyance facilities and conservation measures  
13 would generate the same noise effects as described under Alternative 1C. Where these noise effects  
14 would overlap with census blocks or block groups with meaningfully greater minority or low-  
15 income communities they would result in a disproportionate effect on those populations. Although  
16 mitigation measures and an environmental commitment are available to address this temporary  
17 effect, because the noise and vibration effects would occur in areas with meaningfully greater  
18 minority and low-income populations, this represents a disproportionate effect. This effect is  
19 considered adverse because it would occur in a geographic location with a meaningfully greater  
20 minority population.

### 21 **28.5.11.8 Public Health**

22 Chapter 25, *Public Health*, identifies the potential for the operation of all west alignment alternatives  
23 to increase concentrations of bromide and associated DPBs at Barker Slough, a source of water for  
24 the North Bay Aqueduct. (as described in Chapter 25, *Public Health*, Mitigation Measure WQ-5). In  
25 addition, the contribution of all west alignment alternatives would add to the foreseeable future  
26 increase in DPBs that would happen in the absence of the project, as described in Chapter 25, *Public*  
27 *Health*, Section 25.4. Because the increase in bromide and DPBs would decrease water quality for  
28 Solano County service area, a service area with a meaningfully greater minority population, this  
29 would disproportionately affect minorities. This is an adverse effect.

30 In addition, Chapter 25, *Public Health*, also analyzed the potential for operations under Alternative  
31 6C to increase the body burden of mercury in fish relative to Existing Conditions. The greatest  
32 increase was at Franks Tract and Old River at Rock Slough relative to Existing Conditions. Because  
33 minority populations are known to practice subsistence fishing and consume fish exceeding US EPA  
34 reference doses, any increase in the fish body burden of mercury may contribute to an existing  
35 adverse effect. These effects are considered unmitigable (see Chapter 8, *Water Quality*, Mitigation  
36 Measure WQ-13). Because subsistence fishing is specifically associated with minority populations in  
37 the Delta compared to the population at large this effect would be disproportionate on those  
38 populations for Alternative 6C. This effect would be adverse. This effect would not be adverse for  
39 other west alignment alternatives (1C and 2C).

## 1      **Summary of Environmental Justice Effects Under Other West Alignment** 2      **Alternatives**

3      Implementation of Alternatives 2C and 6C would result in disproportionate effects on minority and  
4      low-income communities resulting from land use, socioeconomics, aesthetics and visual resources,  
5      cultural resources, noise, and public health effects. The same mitigation measures and  
6      environmental commitments described under Alternative 1C would reduce the severity of these  
7      effects, but would not entirely avoid these effects. Because these effects would result in adverse  
8      disproportionate effects on minority and low-income populations, these effects are considered  
9      adverse and disproportionate.

### 10     **28.5.12      Alternative 9—Through Delta/Separate Corridors** 11     **(15,000 cfs; Operational Scenario G)**

12      This section analyzes the environmental justice effects of the resource topics that are carried  
13      forward for detailed analysis for Alternative 9. Relevant environmental justice effects associated  
14      with adverse effects identified in these chapters are analyzed to determine if they would result in a  
15      disproportionate effect on minority or low-income populations. Figures 28-1 and 28-2 show the  
16      distribution of minority and low-income populations in relation to Alternative 9.

#### 17     **28.5.12.1      Land Use**

18      Construction of this alternative, particularly the intake structures and new segment of canal  
19      extending south from Clifton Court Forebay, would require the disruption of approximately 255  
20      structures throughout the alternative footprint, including an estimated 74 residential buildings.  
21      Construction of the intakes and canal, as well as channel dredging activities, would also conflict with  
22      private recreational structures. Chapter 13, *Land Use*, Section 13.3.3.2, Table 13-4 summarizes the  
23      estimated number of structures affected across structure type and alternative and Mapbook Figure  
24      M13-4 shows the distribution of these effects across the Through Delta/Separate Corridors  
25      conveyance alignment. There would likely be relocation or removal of residential structures  
26      associated with construction of new channel connections, permanent access roads, and borrow  
27      areas. As shown in Figures 28-1 and 28-2, there are census blocks with a meaningfully greater  
28      minority population and block groups with meaningfully greater low-income populations in the  
29      vicinity of Alternative 9 construction activities (e.g., construction associated with the new segment  
30      of canal extending south from Clifton Court Forebay). Therefore, displacement of residences as a  
31      result of Alternative 9 would have the potential to result in an adverse effect on minority and low-  
32      income populations.

33      When required, DWR would provide compensation to property owners for property losses due to  
34      implementation of the alternative. Compensation would reduce the severity of economic effects  
35      related to this physical effect, but would not reduce the severity of the physical effect itself. This  
36      effect would remain adverse, because the affected residences occur in a geographic location with  
37      meaningfully greater minority and low-income populations.

#### 38     **28.5.12.2      Socioeconomics**

39      The same impact mechanisms identified for Alternative 1A would result in effects on local  
40      employment conditions under Alternative 9 (Impacts ECON-1 and ECON-7). The general economic  
41      effects of reduced export alternatives (6A, 6B, 6C, 7, and 8) on south-of-Delta areas are described in

1 Chapter 30, *Growth Inducement and Other Indirect Effects*, Section 30.3.2. Other effects in Chapter 16,  
 2 *Socioeconomics*, Section 16.3.3.16, are not analyzed in this section because they either relate to  
 3 program-level conservation measures that do not have sufficient project-level detail to identify  
 4 environmental justice consequences, or because they do not have the potential to disproportionately  
 5 affect environmental justice populations.

6 As described in Chapter 16, *Socioeconomics*, Section 16.3.3.16, Impact ECON-1, construction of the  
 7 proposed water conveyance facilities would increase total employment and income in the study  
 8 area. The change would result from expenditures on construction and from changes in agricultural  
 9 production. Changes in jobs in the study area as a result of construction are reported in Chapter 16,  
 10 *Socioeconomics*, Section 16.3.3.16, Table 16-51. During the peak construction years, it is estimated  
 11 that 3,209 jobs (direct) and 6,371 jobs total (direct, indirect, and induced effects) would be gained in  
 12 the study area.

13 However, construction of conveyance and related facilities such as roads and utilities would cause  
 14 temporary and permanent conversion of agricultural land. Because construction would reduce  
 15 agricultural land under cultivation, construction would result in the direct loss of 10 agricultural  
 16 jobs/year and a total loss of 38 agricultural jobs/year (including direct, indirect and induced effects)  
 17 (Chapter 16, *Socioeconomics*, Section 16.3.3.16, Table 16-52).

18 Chapter 16, *Socioeconomics*, Section 16.3.3.16, Impact ECON-7, identifies employment effects  
 19 associated with operation of conveyance facilities. Alternative 9 would result in the direct creation  
 20 of 121 jobs/year and the creation of 177 jobs total (Chapter 16, *Socioeconomics*, Section 16.3.3.16,  
 21 Table 16-54). However, because operations would reduce agricultural cultivation, operations would  
 22 result in the direct loss of 14 agricultural jobs/year and a total of 36 agricultural jobs/year (direct,  
 23 indirect and induced effects) (Chapter 16, *Socioeconomics*, Section 16.3.3.16, Table 16-55).

24 Because the majority of farm labor in the study area is minority, including those of Hispanic origin  
 25 and potentially low-income, loss of up to 38 agricultural jobs in the study area associated with  
 26 construction of the conveyance facility is considered to be a disproportionate effect on an  
 27 environmental justice population. However, the overall employment effect in the study area related  
 28 to construction and operation of the conveyance facility would be an increase in construction and  
 29 facility operation employment which may have some unknown positive effect on the environmental  
 30 justice population in the study area. Despite the potential for a beneficial employment effect in the  
 31 study area under Alternative 9 the adverse effect on agricultural workers is considered a  
 32 disproportionate effect because this effect would be predominately borne by a minority population  
 33 currently employed by the agriculture industry in the study area.

### 34 **28.5.12.3 Aesthetics and Visual Resources**

35 The construction of conveyance facilities for Alternative 9 has the potential to result in adverse  
 36 effects on the visual environment. Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.16,  
 37 identifies the following adverse effects.

#### 38 **Impact AES-1: Substantial Alteration in Existing Visual Quality or Character during** 39 **Construction of Conveyance Facilities**

#### 40 **Impact AES-2: Permanent Effects on a Scenic Vista from Presence of Conveyance Facilities**

1 **Impact AES-3: Permanent Damage to Scenic Resources along a State Scenic Highway from**  
 2 **Construction of Conveyance Facilities**

3 **Impact AES-4: Creation of a New Source of Light or Glare That Would Adversely Affect Views**  
 4 **in the Area as a Result of Construction and Operation of Conveyance Facilities**

5 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.16, Impact AES-6, analyzes the effect of  
 6 the implementation of CM2–CM22 on aesthetic and visual resources. This effect is adverse. However  
 7 because the precise location of where future conservation measures will be implemented is  
 8 unknown, this impact is not carried forward for further analysis of environmental justice effects for  
 9 this alternative or other alternatives.

10 Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.16, also identifies the following mitigation  
 11 measures that would reduce the identified effects on aesthetics and visual resources.

12 **Mitigation Measure AES-1a: Locate New Transmission Lines and Access Routes to**  
 13 **Minimize the Removal of Trees and Shrubs and Pruning Needed to Accommodate New**  
 14 **Transmission Lines and Underground Transmission Lines Where Feasible**

15 **Mitigation Measure AES-1b: Install Visual Barriers between Construction Work Areas and**  
 16 **Sensitive Receptors**

17 **Mitigation Measure AES-1c: Develop and Implement a Spoil/Borrow and Reusable Tunnel**  
 18 **Material Area Management Plan**

19 **Mitigation Measure AES-1d: Restore Barge Unloading Facility Sites Once Decommissioned**

20 **Mitigation Measure AES-1e: Apply Aesthetic Design Treatments to All Structures to the**  
 21 **Extent Feasible**

22 **Mitigation Measure AES-1f: Locate Concrete Batch Plants and Fuel Stations Away from**  
 23 **Sensitive Visual Resources and Receptors and Restore Sites upon Removal of Facilities**

24 **Mitigation Measure AES-1g: Implement Best Management Practices to Implement Project**  
 25 **Landscaping Plan**

26 **Mitigation Measure AES-4a: Limit Construction to Daylight Hours within 0.25 Mile of**  
 27 **Residents**

28 **Mitigation Measure AES-4b: Minimize Fugitive Light from Portable Sources Used for**  
 29 **Construction**

30 **Mitigation Measure AES-4c: Install Visual Barriers along Access Routes, Where Necessary,**  
 31 **to Prevent Light Spill from Truck Headlights toward Residences**

32 **Mitigation Measure AES-6a: Underground New or Relocated Utility Lines Where Feasible**

33 **Mitigation Measure AES-6b: Develop and Implement an Afterhours Low-intensity and**  
 34 **Lights off Policy**

1           **Mitigation Measure AES-6c: Implement a Comprehensive Visual Resources Management**  
2           **Plan for the Delta and Study Area**

3           Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.16, Impacts AES-1 through AES-4,  
4           describe the aesthetics and visual resources effects associated with water conveyance facilities  
5           construction and operations. Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.16, Impact  
6           AES-3, describes the effects on local scenic highways, such as SR 160. Because degradation of a  
7           scenic highway would result in loss of scenic qualities for all highway users, it is not carried forward  
8           for environmental justice analysis.

9           Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.16, Impact AES-1, describes the effect of  
10          construction activities on the visual quality and character of the study area. Visual effects of  
11          Alternative 9 would be substantial—primarily in the areas surrounding the fish screens, operable  
12          barriers, pumping plants, channel modifications, spoil/borrow areas, transmission lines, and the on-  
13          channel levee at Hammer Island. These changes would be most evident near Locke and Walnut  
14          Grove, which would undergo extensive changes from the permanent establishment of large  
15          industrial facilities and the supporting infrastructure along and surrounding the 1.2-mile segment of  
16          the Sacramento River where the fish screen would be situated, in addition to the operable barriers,  
17          bridges, and transmission lines that would be introduced. In San Joaquin County, the operable  
18          barrier across Old River on the Middle River and dredging activities would be visible from Bacon  
19          Island Road. Alternative 9 would introduce visually dominant and discordant features in the  
20          foreground and middleground views that would be very noticeable to all viewer groups. These  
21          changes would occur in an area known for its open space, agricultural landscapes, and rural  
22          characteristics. Therefore, because of the long-term nature of construction; proximity to sensitive  
23          receptors; razing of the marina, docks, and landings; removal of vegetation; changes to topography  
24          through grading; transmission lines; and addition of large-scale industrial structures where none  
25          presently exist, this effect is considered adverse. Mitigation Measures AES-1a through AES-1e are  
26          available to address visual effects. No concrete batch plants or fuel stations have been identified for  
27          Alternative 9.

28          Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.16, Impact AES-2, describes the  
29          permanent alteration of scenic resources resulting from construction. The greatest changes would  
30          occur in the vicinity of Locke and Walnut Grove, where scenic vistas exist along SR 160 and River  
31          Road, and waterways where operable barriers and pumping plants would be placed. Large scale  
32          spoil areas for dredge material would also cause permanent and adverse landscape changes.  
33          Because of the long-term nature of construction combined with the proximity to sensitive receptors;  
34          razing of the marina, docks, and landings; removal of vegetation; changes to topography through  
35          grading; transmission lines; and addition of large-scale industrial structures where none presently  
36          exist, this effect may be considered adverse. Mitigation Measures AES-1a, AES-1c, and AES-1e are  
37          available to address visual effects.

38          Chapter 17, *Aesthetics and Visual Resources*, Section 17.3.3.16, Impact AES-4, describes the potential  
39          for new sources of light and glare that would be introduced during construction or as part of  
40          permanent features that would remain after the conveyance facilities are complete. The short canal  
41          segment at the very southern end of this conveyance option would introduce a new reflective  
42          surface and thus a new source of glares. Nighttime lighting at fish screens and pumping plants would  
43          introduce ambient light into a visual landscape that generally has low levels of nighttime light. Night  
44          time safety lighting would be used at operable barriers and the canal segment, adding additional  
45          sources of light to the dark night landscape.

1 services and utilities. Under Alternative 9, operation of project facilities would conflict with existing  
 2 utility facilities. Existing intakes would require decommissioning and potential relocation.  
 3 Agricultural drainage ditches would need to relocate their discharge points. Because the relocation  
 4 and potential disruption of utility infrastructure would be required this could create environmental  
 5 effects that would be considered adverse. Mitigation Measures UT-6a, UT-6b, and UT-6c would  
 6 reduce these effects, but they would still remain adverse. However, these effects on intakes and  
 7 drainage ditches would not be expected to create disproportionate effects on any minority or low-  
 8 income populations. This would not be adverse.

9 Chapter 20, *Public Services and Utilities*, Section 20.3.3.16, Impact UT-8, describes the potential  
 10 consequences of conservation measures on public services at a program-level of detail. The location  
 11 and construction or operational details (i.e., water consumption and water sources associated with  
 12 conservation measures) for these facilities and programs have not been developed. Therefore, the  
 13 need for new or expanded water or wastewater treatment facilities and the potential to disrupt  
 14 utilities and service in the study area is unknown. Mitigation Measures UT-6a, UT-6b, and UT-6c  
 15 would reduce adverse effects on utilities; however, because the effectiveness of these measures is  
 16 unknown, this impact is adverse. Because the effect topic analyzes these effects at a general level of  
 17 detail, it is not amenable to analysis to determine if it would result in an effect on an environmental  
 18 justice population. Project-level analysis of effects on environmental justice populations would be  
 19 addressed as part of future environmental analysis for implementation of conservation measures.

## 20 **28.5.12.6 Air Quality and Greenhouse Gas Emissions**

21 As discussed under Alternative 9, Chapter 22, *Air Quality and Greenhouse Gases*, Section 22.3.3.16  
 22 addresses the potential effects for a BDCP alternative to generate criteria pollutants that exceed air  
 23 quality district and federal *de minimis* thresholds, and to expose sensitive receptors to health risks in  
 24 excess of local air quality management district thresholds, from construction of the proposed water  
 25 conveyance facilities or implementation of CM2-11. The following adverse effects are relevant to this  
 26 analysis.

### 27 **Impact AQ-2: Generation of Criteria Pollutants in Excess of the SMAQMD Thresholds during** 28 **Construction of the Proposed Water Conveyance Facility**

### 29 **Impact AQ-9: Generation of Criteria Pollutants in the Excess of Federal *De Minimis* Thresholds** 30 **from Construction and Operation and Maintenance of the Proposed Water Conveyance** 31 **Facility**

### 32 **Impact AQ-11: Exposure of Sensitive Receptors to Health Risks in Excess of SMAQMD's** 33 **Health-Risk Assessment Thresholds**

### 34 **Impact AQ-18: Generation of Criteria Pollutants from Implementation of CM2-CM11**

35 As described in Impact AQ-2, construction of Alternative 1B would generate fugitive dust emissions  
 36 exceeding SMAQMD thresholds. The effect of generating emissions in excess of local air district  
 37 thresholds would therefore violate applicable air quality standards in the study area and could  
 38 contribute to or worsen an existing air quality conditions. No feasible mitigation is available to  
 39 reduce fugitive dust emissions; therefore, the effect would remain adverse.

40 As described in Impact AQ-9, construction of the water conveyance facilities under this alignment  
 41 would exceed SJVAB federal *de minimis* thresholds for CO. DWR has identified several environmental

1 commitments to reduce construction-related criteria pollutants. However, because the current  
2 emissions estimates exceed the SJVAB federal *de minimis* threshold for CO, a positive conformity  
3 determination for CO cannot be satisfied through the purchase of offsets within the SJVAB. This  
4 effect would remain adverse. In the event that Alternative 1B is selected, Reclamation, USFWS, and  
5 NMFS would need to demonstrate that conformity is met for CO through a local air quality modeling  
6 analysis (i.e., dispersion modeling) to ensure project emissions do not cause or contribute to any  
7 new violation of the CO NAAQS or increase the frequency or severity of any existing violation of the  
8 CO NAAQS.

9 As described in Impact AQ-11, construction of Alternative 9 would require the use of diesel-fueled  
10 engines. Potential sources of DPM include exhaust emissions from onroad vehicles; offroad vehicles  
11 (e.g., loaders, dozers, graders); and portable equipment (e.g., compressors, cranes, generators).  
12 Because of the intensity and scale of construction activities during which these diesel powered  
13 engines would be used in areas of heavy construction such as operable barriers, fish screens, dredge  
14 spoil areas and concrete batch plants, construction could expose nearby sensitive receptors to  
15 substantial pollutant concentrations, potentially resulting in adverse health effects. The maximally  
16 exposed sensitive receptor area associated with exceedances of carcinogenic thresholds is located in  
17 the Walnut Grove/Locke area adjacent to areas where operable barriers and fish screens would be  
18 installed. These health effects are deemed adverse because they would exceed the SMAQMD  
19 thresholds for cancer-risk associated with DPM emissions. Due to the large number of sensitive  
20 receptors that would be exposed to DPM emissions, it would be infeasible to relocate these  
21 residences.

22 As described in Impact AQ-18, implementation of CM2-11 under Alternative 1B would result in an  
23 adverse effect if the incremental difference, or increase, relative to Existing Conditions exceeds  
24 applicable local air district thresholds. These effects are expected to be further evaluated and  
25 identified in the subsequent project-level environmental analysis conducted for the CM2-CM11  
26 restoration and enhancement actions. Mitigation Measure AQ-18 would be available to reduce this  
27 effect.

28 **Mitigation Measure AQ-18: Develop an Air Quality Mitigation Plan (AQMP) to Ensure Air**  
29 **District Regulations and Recommended Mitigation are Incorporated into Future**  
30 **Conservation Measures and Associated Project Activities**

31 However, it may not be sufficient to reduce emissions below applicable air quality management  
32 district thresholds. Consequently, this impact would be adverse.

33 Given that the proposed water conveyance facilities and the restoration and conservation areas  
34 along this alignment are proximate to census blocks and block groups where meaningfully  
35 greater minority and low-income populations occur (Figures 28-1 and 28-2), it is expected that  
36 generation of criteria pollutants in excess of local air district and federal *de minimis* thresholds,  
37 as well as exposure of sensitive receptors to health risks in excess of local air district thresholds,  
38 would result in a potentially disproportionate effect on minority and low-income populations.  
39 See Chapter 30, *Growth Inducement and Other Indirect Effects*, for discussion on any indirect  
40 effects on export service areas.

## 1 **28.5.12.7 Noise**

2 Chapter 23, *Noise*, Section 23.4.3.16, identifies the following adverse effect associated with new  
3 sources of noise and vibration that would be introduced into the study area during construction and  
4 operations of Alternative 9.

### 5 **Impact NOI-1: Exposure of Noise-Sensitive Land Uses to Noise from Construction of Water** 6 **Conveyance Facilities**

### 7 **Impact NOI-4: Exposure of Noise-Sensitive Land Uses to Noise from Implementation of** 8 **Proposed Conservation Measures**

9 Chapter 23, *Noise*, Section 23.4.3.16, Impact NOI-1, describes noise effects associated with the  
10 construction of this alternative that would occur at discrete locations at construction work sites, and  
11 would affect adjacent residents. Specifically, as described in Chapter 23, *Noise*, Section 23.4.3.16,  
12 Impact NOI-1, noise from construction of facilities and truck traffic and worker commutes is  
13 predicted to exceed daytime and nighttime noise standards in areas zoned for sensitive land uses  
14 including residential, natural/recreational, agricultural residential, and schools at the locations  
15 listed below.

- 16 ● Sacramento County – including neighborhoods in the communities of Walnut Grove, Grand  
17 Island Estates, and Locke.
- 18 ● San Joaquin County.
- 19 ● Contra Costa County.
- 20 ● Alameda County.

21 Construction of operable barriers and pumping plants under Alternative 9 would require the use of  
22 impact-driven sheet piles to construct cofferdams and barrier foundations. Potential reasonable  
23 worst-case equipment noise levels from construction work areas would be comparable to those  
24 listed for the intake sites for other alternatives. Pile driving and tunneling activities during  
25 construction of the intakes and conveyances could result in substantial increases in noise levels  
26 affecting nearby communities and residences.

27 As shown in Figures 28-1 and 28-2, there are census blocks and block groups with meaningfully  
28 greater proportions of minority and low-income populations in the vicinity of areas of heavy  
29 construction work areas (i.e., operable barriers, fish screens, dredge spoil areas and concrete batch  
30 plants) where vibration and noise effects are predicted to exceed noise standards for nearby  
31 residents. Construction of intakes and the tunnel would result in excessive groundborne vibration  
32 and groundborne noise levels at nearby receptors, including residential structures. The effect of  
33 exposing sensitive receptors to vibration or groundborne noise would be adverse.

34 Chapter 23, *Noise*, Section 23.4.3.16, Impact NOI-4, describes the noise effects of conservation  
35 measures. Because the conservation measures are analyzed at a program-level of detail, and have  
36 not been refined to specific projects with discrete locations, it would be difficult to analyze potential  
37 disproportionate effects on environmental justice populations. However, because of the distribution  
38 of minority and low-income populations in the study area, there is a potential for such effects.

39 Although implementation of mitigation measures and the environmental commitment to develop  
40 and implement a Noise Abatement Plan would be available to reduce these effects, it is not

1 anticipated that feasible measures would be available in all situations to reduce construction noise  
 2 to levels below the applicable thresholds. The effect of exposing noise-sensitive land uses to noise  
 3 increases above thresholds is considered adverse. Although mitigation measures are available to  
 4 address this temporary effect, because the noise and vibration effects would occur in areas with  
 5 meaningfully greater minority and low-income populations, this represents a disproportionate  
 6 effect. This effect is considered adverse because it would occur in a geographic location with a  
 7 meaningfully greater minority and low-income population.

## 8 **28.5.12.8 Public Health**

9 Chapter 25, *Public Health*, Section 25.3.3.16, identifies the potential for the operation of this  
 10 alternative to increase concentrations of bromide and associated DPBs at Barker Slough, a source of  
 11 water for the North Bay Aqueduct:

### 12 **Impact PH-2: Exceedances of Water Quality Criteria for Constituents of Concern Such That** 13 **There Is an Adverse Effect on Public Health as a Result of Operation of the Water Conveyance** 14 **Facilities**

15 In addition, the contribution of this alternative would add to the foreseeable future increase in DPBs  
 16 that would happen in the absence of the project, as described in Chapter 25, *Public Health*, Section  
 17 25.4. This would be an adverse effect because these chemicals are associated with adverse health  
 18 effects. Mitigation Measure WQ-5 is available to reduce this effect:

#### 19 **Mitigation Measure WQ-5: Avoid, Minimize, or Offset, as Feasible, Adverse Water Quality** 20 **Conditions**

21 While Mitigation Measure WQ-5 may reduce this effect, the feasibility and effectiveness of this  
 22 mitigation measure is uncertain based on currently available information. Therefore, the  
 23 available mitigation would not necessarily reduce the effect and it may remain adverse.

24 The North Bay Aqueduct serves Napa and Solano Counties. This analysis assumes the decrease  
 25 in water quality for waters conveyed in this aqueduct would affect the entire service population  
 26 using water from the North Bay Aqueduct, which is approximately the same as the demographic  
 27 profile for each county as a whole. Napa County as a whole does not have a meaningfully greater  
 28 minority population (the total minority population is approximately 44%, U.S. Census Bureau  
 29 2012a). Solano County however has a total minority population of approximately 59% (U.S.  
 30 Census Bureau 2012b). Neither county has a meaningfully greater low-income population.  
 31 Because the increase in bromide and DPBs would decrease water quality for Solano County  
 32 service population, this would disproportionately affect minorities. This is an adverse effect.

33 In addition, Chapter 25, *Public Health*, Section 25.3.3.16, also analyzed the potential for  
 34 operations under Alternative 9 to increase the body burden of mercury in fish relative to  
 35 Existing Conditions. The greatest increase was at Franks Tract and Old River at Rock Slough  
 36 relative to Existing Conditions. Because minority populations are known to practice subsistence  
 37 fishing and consume fish exceeding US EPA reference doses, any increase in the fish body  
 38 burden of mercury may contribute to an existing adverse effect. These effects are considered  
 39 unmitigable (see Chapter 8, *Water Quality*, Mitigation Measure WQ-13). Because subsistence  
 40 fishing is specifically associated with minority populations in the Delta compared to population  
 41 at large this effect would be disproportionate on those populations for Alternative 6C. This effect  
 42 would be adverse.

## 28.5.12.9 Summary of Environmental Justice Effects under Alternative 9

Implementation of Alternative 9 would result in disproportionate effects on minority and low-income communities resulting from land use, socioeconomic, aesthetics and visual resources, cultural resources, air quality and greenhouse gas emissions, noise, and public health effects. While mitigation measures and environmental commitments would reduce these effects, the effects would not be avoided entirely. The effects would remain adverse.

## 28.5.13 Cumulative Analysis

### 28.5.13.1 Assessment Methodology

There is a potential for disproportionate effects on minority and low-income populations to occur in the study area as a result of past, present, and reasonably foreseeable future projects due to the concentration of minority and low-income populations in the study area (see Figures 28-1 and 28-2). It is expected that some disproportionate effects on environmental justice populations could occur because of the concentration of such populations in the study area, even though it is assumed that reasonably foreseeable future projects would include typical design and construction practices to avoid or minimize potential adverse effects. Accordingly, this section analyzes the cumulative effect of the combined set of reasonably foreseeable projects and programs on environmental justice populations.

This cumulative effects analysis considers projects that could have the potential to result in disproportionately high and adverse effects on minority and low-income populations through a two-step analysis. This section first summarizes the cumulative context of environmental justice effects, including the contribution of the BDCP. This section then analyzes the contribution of the BDCP to determine if this contribution is cumulatively considerable in relation to the context.

Table 28-4 below lists projects that have the potential to result in disproportionate effects on minority and low-income populations in the study area, and particularly within the geographic scope of effects identified in this chapter (e.g., areas of heavy construction associated with the intakes, pipeline/tunnel, and other features).

**Table 28-4. Environmental Justice Effects of Plans, Policies, and Programs Considered for Cumulative Analysis**

Agency	Program/ Project	Status	Description of Program/Project	Environmental Justice Effects
California High Speed Rail Authority	The Altamont Corridor Rail Project	Planning; Alternative Analysis	Project would provide a dedicated passenger rail connection between northern San Joaquin Valley and the San Francisco Bay Area via the Altamont Pass.	Current alternative alignments are located west of Interstate 5 in Stockton and near Tracy. Has the potential to affect environmental justice communities in the urban areas of Stockton, rural areas, and in Tracy—outside the construction impact areas for BDCP.

Agency	Program/ Project	Status	Description of Program/Project	Environmental Justice Effects
Freeport Regional Water Authority and Bureau of Reclamation	Freeport Regional Water Project	Project was completed late 2010. Estimated completion of water treatment plant in 2012	Project includes an intake/pumping plant near Freeport on the Sacramento River and a conveyance structure to transport water through Sacramento County to the Folsom South Canal	No environmental justice effects identified as a result of the project
Bureau of Reclamation	Delta-Mendota Canal/California Aqueduct Intertie	Program under development. Final EIS/EIR in 2009. Record of Decision (ROD) in 2009	The purpose of the intertie is to better coordinate water delivery operations between the California Aqueduct (state) and the Delta-Mendota Canal (federal) and to provide better pumping capacity for the Jones Pumping Plant. New project facilities include a pipeline and pumping plant	No environmental justice effects identified as a result of the project
Bureau of Reclamation, California Department of Water Resources	South Delta Improvements Program	Ongoing program. Final EIR/EIS 2006	Project to increase water levels and improve circulation patterns and water quality while improving operational flexibility of the State Water Project	No environmental justice effects identified as a result of the program
California Department of Water Resources	Temporary Barriers Project 2001–2007	Mitigated Negative Declaration 2000	Project to seasonally install up to three rock flow control structures and one rock fish control structure in south Delta channels at various times during a seven-year period (2001–2007), or until permanent flow control structures are constructed. Purpose is to protect San Joaquin salmon migrating through the Delta and provide an adequate agricultural water supply in terms of quantity, quality, and channel water levels to meet the reasonable and beneficial needs of water users in the South Delta Water Agency.	No environmental justice effects identified as a result of the project
	Suisan Marsh Habitat Management, Preservation, and Restoration Plan (SMP)	Final EIS/EIR 2011	The SMP is intended to balance the benefits of tidal wetland restoration with other habitat uses in the Marsh by evaluating alternatives that provide a politically acceptable change in Marsh-wide land uses, such as salt marsh harvest mouse habitat, managed wetlands, public use, and upland habitat.	No environmental justice effects identified as a result of the project
